If you want better video you will have to get a MegaSTe or TT or a
Falcon. There are a number of VME slot video boards available for the
MegaSTe and TT and they run quite quickly as a matter of fact. At least
my Crazy Dots does at even 32K colors and resolutions as high as
1280x1024 which is about all that poor IBM monitor can handle. The Falcon
is easily capable of 800x600 at 256 colors on a SVGA monitor and I've
personally seen it go to 1600x600 on an SC1224. That resolution is not
for the faint of heart or anyone wishing to keep their eyesight intact.

2. Compiling MiNT 1.08

Newsgroup: comp.sys.atari.st
Date: 1994-01-01 00:12:03 UTC
From: mbaffoni@farad.elee.calpoly.edu
Message-ID: <1994Jan01.001203.166470@zeus.aix.calpoly.edu>
Source record: 195954

Hi All,

I've just finished downloading what I think to be all of the necessary files to get a gcc compiler up and working, along with the latest version of make. Not one to start small, I've decided to start by compiling MiNT (actually, I did that because I really don't have any other compilable code of any considerable size - it passes hello world ok :}).

Anyway, I've got these errors that are pretty cryptic to me (having only had UNIX C experience, I don't know where to look for missing functions...). I get the following output trying to make MiNT 1.08 (I am using TCSH 6.02, Gcc 2.2.2 PL3 [waiting for the 2.5.x to settle], MiNT incl/libs pl39, on a TT with 16/2MB RAM runnig MTOS (Mint 1.04)):

```
----------8<---------------------------->8----------------------
%make -f makefile
gcc -G -Wall -O2 -fomit-frame-pointer -mshort -DMULTITOS -DDEBUG_INFO -c
bios.c -o bios.o
bios.c: In function `bconstat':
bios.c:136: unknown register name `memory' in `asm'
bios.c:136: warning: `retvalue' may be used uninitialized in this function
bios.c:136: warning: `retvalue' may be used uninitialized in this function
bios.c: In function `bconin':
bios.c:185: unknown register name `memory' in `asm'
bios.c:191: unknown register name `memory' in `asm'
bios.c:185: warning: `retvalue' may be used uninitialized in this function
bios.c:185: warning: `retvalue' may be used uninitialized in this function
bios.c:191: warning: `retvalue' may be used uninitialized in this function
bios.c:191: warning: `retvalue' may be used uninitialized in this function
bios.c: In function `bconout':
bios.c:257: unknown register name `memory' in `asm'
bios.c:264: unknown register name `memory' in `asm'
bios.c:274: unknown register name `memory' in `asm'
bios.c:290: unknown register name `memory' in `asm'
--------------8<------------------>8--------------------
```

There was more, but I decided I'd seen enough and cntl-c'd out.

BTW, do you need to put something in setenv to just be able to type make in a directory so that any file named makefile is automaticaly "make"d? Right now, I have to do the make -f to get it to run.

Thanks for any help!

-MikeB

3. Re: New Falcon user questions

>and STorm without success.) Has anyone else successfully transferred files
>over a direct serial connection?

LittleNet and a couple of midi cables did the job quite nicely for me.
You should be able to find it at Atari Archive. If I am not mistaken (and
someone here will be sure to correct me in no uncertain terms if I am)
LittleNet will give you 38400 speed and error free transfers in either
direction. At least it did for me.

>(2) How do you lower the !@#$% volume in Breakout? It seems to keep setting
>the volume of the internal speaker to maximum.

Cut the wires and remove the speaker. Go get a pair of cheapo (or better
if you wish) PC speakers with a volume control/amplifier. You'll be much
happier. These can be had for as little as $10US a pair.

I don't have a clue about the rest of your questions, so I won't show my
ignorance by commenting upon them.

5. Top Ten List

Newsgroup: comp.sys.atari.st
Date: 1994-01-01 01:16:26 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <2g2ita$139@charm.magnus.acs.ohio-state.edu>
Source record: 195956

Well the month is almost up and so is the voting. Due to several requests I will take submissions through the first week of January, so as to accomodate people returning from winter break. But don't let this stop you from sending me your list now.

I have received a number of votes so far, but the more I get the more accurate this list will be. So please take the time if you haven't already and send me a list of your personal favorite programs that came out in 1993.

The criterea is simple, the program must have had an upgrade or version released sometime in 1993.

In your list please send the following

Name of program
Category (application/game whatever)
Author
Shareware/PD/Commercial status
Reason you like this program

You can send as many nominations as you like as long as the aren't overlapping categories.

Thank you for you time and interest in this effort.

Thanks again to all that have helped so far.

And of Course Happy New Year!

Dan Ackerman

ackerman.29@osu.edu

6. STEs for sale

Newsgroup: comp.sys.atari.st

I have the following for sale:

Package: posted for a friend.
1040STE 2 Meg
1224 Color Monitor
Supra 20 Meg HD
SX212 Modem
Disks, joysticks

Make offer.

Stuff I'm selling:
Mega STE 2 MB w/ 120 Meg HD (Quantum) - $500 obo
1040STE 4 meg w/ AdSpeed & TT touch - $350 obo
SC1224 Color monitor - $125
External 80Meg HD. (ICD HA, Seagate, Small Shoebox) - $170

Leave mail if interested.

7. SLM and TT memory

Newsgroup: comp.sys.atari.st
Date: 1994-01-01 02:10:53 UTC
From: fox@vulcan.nrlssc.navy.mil
Message-ID: <2g2m3d$fc3@vulcan.nrlssc.navy.mil>
Source record: 195972

I ran across a curiosity last week - my SLM laser printer seems to work directly from TT memory now... It didn't used to - if I ran pagestream from tt memory and printed, the page would be corrupted in various ways. So I made two copies of the pagestream binary and set the TT flags on one of them and the ST flags on theother. (Run the TT version to create the document, then exit and run the ST version to print...) That worked for several months until last week I printed from the TT-flagged version by mistake. And it came out fine. So I've started printing from it regularly now without a problem.

From everything I've read (and seen in the past), this should not be possible... Any ideas on why this works now? The only thing that's been changed in the last few weeks is I installed MultiTOS, but I usually deactivate it at bootup when I'm running pagestream. Is there something about multitos (even when disabled) that allows the use of tt memory with the laser printer?

Weird.

> and increase the size, and brightness and etc. Please let someone
> who knows what he is doing, do it. I have fixed a dozen or so monitors
> this way.

Two notes.

1. DEATH WARNING! DEATH WARNING! Monitors can hold a lethal charge for some time EVEN WHEN UNPLUGGED. There is some serious high voltage in there. Use a plastic screwdriver, touch nothing but the pots (particularly the thingy on the back of the CRT).

2. In some sense, brightness and focus are synonymous with monitors. Thus, if you tweek up the brightness internally, you will probably screw up the focus. You could probably diddle with the other pots and make it acceptable, but the only real way to do it is with an oscilloscope and a manual for that particular CRT. I have done this (the "Conan method", sans scope and manual) with several Sun 3/50 monitors, and managed to make them usable (and bright enough to see). I suggest that you make a mark or scratch on all the pots before you move them, so you can punt if you need to.

I don't mean to disuade you from this strategy, I only wish to clarify that you need to be REALLY careful and that you are not guaranteed better results.

9. Mega STe questions

Newsgroup: comp.sys.atari.st
Date: 1994-01-01 03:42:57 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2g2rg1$aui@mailer.fsu.edu>
Source record: 195959

I am considering the purchase of a used Mega STe. My understanding is that one can switch between 8 and 16mHz CPU modes. My questions:

1. What software does work on a regular STe, but not on a Mega STe? I have seen lists of showing what works on regular ST's, but not STes. However, I have yet to see one that differentiates between STe and Mega STe models.

2. Is the Mega STe upgradable with SIMMs or SIPPs?

3. How fast can one push the serial port without hardware modifications?

4. It is the case that the MegaSTe offers stereo sound without having to do anything special, right? I am a big MOD file fan, and would like to hear stereo mods as they were intended by the authors. Has anyone run the STe version of Protracker ST on a Mega STe (successfully)?

Thanks in advance for any assistance.

] STe version of Protracker ST on a Mega STe (successfully)?

I've had/seen/heard a Mega-STE playing MOD files at 50Khz, which is
better than they were usually intended for! 8-)

(These will require 8Mhz, no Cache mode as they do some pretty intensive
stuff!) I can't remember which MOD-player/tracker it was, it may
have Been 50-play or CD-Player (CD-Player usually sounds better!))

Hi all,

Was wondering if some one out there has the answer to a few questions.

1. I am currently using multitos (AES 4.0 + MiNT 1.09 [+ net patches]) and
was wondering if anyone was able to get the WF_NEWDESK feature of loading
an alterante OBJECT_TREE for a desktop background to work. It is documented
in the Atari Compendium, but I was not able to get it to work.

2. Anyone know the status of AES 4.1, it seems to have a few new features,
namely: arbitrary Speedo fonts for the system fonts, and Iconization, that
actually put GEM in the class of other window systems. I have not heard of
it being out, or even a possible release date?

3. I also currently have Atari Works 1.2 + a coupon for a free upgrade,
is there a newer version out?

Thanks in advance for any information.

Cheers,
Scott Kolodzieski

Atari United will be carrying version 2.30 of freeze dried term, which is mainly a bug/compatability fix with the screens cleaned up and unused features reworked. Aaron is now working on version 3.0 which he has big plans for, namely writing it in assembler, send/rec fax... and more. since these and other features are not written in stone (or code) I cannot go into them further, but expect to see some news on FZDT in January.

Well I seem to get slightly faster transfers, but there are those who
say XYZ gives them better transfers. I like that fact that it is GEM
based, I hate the look of XYZ. I also had trouble with errors during XYZ
transfers which I don't seem to have with GSZRZ. But I'm not making
absolute claims, I just happen to like it better. I don't really know if
GSZRZ really "beats the hell out of XYZ", perhaps I shouldn't have said
that. But I like it much better.

I got a STacy 4 a while ago and I really would like to get the darned screen to brighten up a bit. Is there anyone out there than knows how to modify the voltage regulation to the screen light so it will be visible in a lit room? The voltage that is going to the screen seems to be AC so I therefore have NO idea what to do.
Drop me E-mail if you have any ideas... Also, can I replace the Stacy screen with a brighter or reflective one?

borg
jperez@uhunix.uhcc.hawaii.edu

PS - Stacy owners, Fast Technologies makes a special Stacy version of the Turbo25 accelerator! Does anyone out there have one?

: 1. What software does work on a regular STe, but not on a Mega STe? I have
: seen lists of showing what works on regular ST's, but not STes.

Primarily, games will have trouble running at 16mhz w/cache if they are
heavily protected. Those darned copy protection schemes use some timing
specific code or something. Other than such games (there are quite a few
that do work well, and the 16mhz is great!) the only programs that I know
of that have trouble are: Photochrome (won't display pictures correctly
in 16mhz mode), Spectum 512 (same problem), and Timworks DTP (won't print
in 16mhz).

: 2. Is the Mega STe upgradable with SIMMs or SIPPs?

The Mega STE uses SIMMS (the Stacy uses SIPPS)

: 3. How fast can one push the serial port without hardware modifications?

To my knowledge, the serial port is limited to 19,200 unless you want to
do some hacking.

: 4. It is the case that the MegaSTe offers stereo sound without having to
: do anything special, right? I am a big MOD file fan, and would like to
: hear stereo mods as they were intended by the authors. Has anyone run the
: STe version of Protracker ST on a Mega STe (successfully)?

The Mega STE has Stereo RCA outputs on the back. There are a number of
excellent MOD player/creators out there that work on the Mega STE.
CD-Player is one of my favorites (and is STE only). Paula II works as a
program or as an accessory (so you can play music in the background).
Esion, Octalyser, and EPSS are stereo trackers - a few of them support
MIDI input, MIDI files, and up to 8 channels of polyphony. DeskTracker
works like Paula but isn't quite as compatible with various MODS (although
it can do playback at 50khz (Paula can only handle 25khz on the Mega STE)
and it has a Spectrum analyser and an O-scope.

Mega STE's are great (can you tell I have one) and with
the Fast Tecnologies Tiny Turbo 030 board, you can accelerate it to 50mhz,
about equivalent to a TT, faster in some respects.

20. Falcon030

Newsgroup: comp.sys.atari.st
Date: 1994-01-01 10:00:09 UTC
From: kfason@csn.org
Message-ID: <CIy3sA.DDL@csn.org>
Source record: 195970

I just got me a Falcon030 today. Thing is I got the 1/0 and got a 4megs module (from the guy who bought my Mega 'E) and I have a gig SCSI. I only got the atari Utils to boot from it though its slower them hell, almost 1.5 minutes. ICDs don't even let me install it on the drive. comes back saying "no partitions that allow autobooting" or something, I'm talking to ICD about it. But anyways my probs are is there some jumpers to set so it bypasses the IDE?? It still tries to boot from it them drops to the SCSI if the IDE is not online.. Like on my mega you had some jumpers you could use if the internal controller was not there so you can use the ASCI port...

thank you.

>do anything special, right? I am a big MOD file fan, and would like t
>hear stereo mods as they were intended by the authors. Has anyone run
>STe version of Protracker ST on a Mega STe (successfully)?

ProTracker (and most other players) work on MEGA STE
Some even gives better sound (they can use 50 kHz on MEGA STE,
but on standard STE 26 kHz is the fastest replay rate), and
with ACCs like Backtrack and DeskTracker you will still have
processor time left for other programs (unlike on the STE :-)

>Has anyone managed to make any _real_ money in Elite II yet? I've been
>playing it for days on end, and can't seem to scrape anything
>substantial together. And has anyone won a battle yet?
>
Money: yep, made loads of it. Stopped bothering with making money for now, and am exploring. The biggest tip is to upgrade your ship quickly. The fighter you start in just doesn't have the space. Here's how I started out:

Trade between Sol and Barnard's star - you can afford to sell your gun for extra cargo space, since these are safeish systems. Take computers/robots to sol, and luxury goods to barnard's.

After you've upgraded a bit, try a bit of smuggling. You seem to get caught about half the time, so save the game before docking/landing and reload if you get caught.

Winning battles: I started playing on an A600, and found it close to impossible to fight manually. The following (together) helped:

1) get a better laser. Start with a 5Mw pulse laser, and then upgrade to a 4Mw beam laser. The extra power seems to give you extra range, which lets you hit people before they hit you.

2) Lock your autopilot onto the enemy ship and let it do the chasing for you - just fire when appropriate. I still do this on the Falcon version (if I'm in a hurry, or its a boring battle) despite the fact that the smoother gameplay makes proper combat attainable.

What ships are people using? I'm in an asp now, and find it the best combination of speed and cargo size (45-50 tons free even with loads of shields, lasers, odds and sods). I like the idea of a souped up freighter, but I'm curious as to how they'd handle.

Also, has anyone found any planets selling military drives above class 3? Or for that matter found any places selling (or in other ways making available) any non-standard equipment? The manual hints at such places, but...

Right. Although I haven't seen Protracker on a MSTe, I have seen both
Jukebox and Paula running without problems on a MSTe (turn on the cache/16MHz
to get better throughput with the higher sampling rates with interpolation
turned on). Of course it sounds much better on a TT since you can run them
at 50KHz with stereo interpolation (and still have enough CPU juice left to do
something useful at the same time).

BTW, does anyone have a good listing of MOD sites? Also, .AVR (that is
the sound format, right?), .WAV and of course raw .SND files.

Aw heck, while I'm at it, does anyone know where to get the THX.snd? I
had it awhile back (it was on a Mac at the time) and over the course of 2 moves
and a theft of my precious (first) TT, I have lost it. Also, someone posted
having a .WAV of the Star Treck (intro?), and I was wondering what its name is
and where to ftp it? I too would love to have it playing while my computer
is loading up .... (yes, a true sign of decadence :}).

Hey, I thought the MSTe offered a second serial port that was the same
as Modem2 (or was that Serial1?) on the TT (which means up to 156k bps)?

>] 4. It is the case that the MegaSTe offers stereo sound without having to

>and where to send it and (last but not least) what I'm getting for it.

Yes, I am still handling US upgrades, at the same Bat-address [a big
:) for all you Batman fans]. The upgrade changes are in the
help section of CoNnect (ie, run CoNnect, hit the Help key, select the "paper"
icon so that all the help subjects are listed alphabetically by subject, select
"History", and you can look at the changes for connect).

For those who don't wish to download the whole thing, here is the
contents of the "Changes in 2.40" which I just pasted, then minor editing to
look pretty (2.42 just added English support).:

The upgrade to CoNnect 2.40 is not free
(DM 10,U$ 8) for the first time.

Help System updated.

Online time display does not flicker.

CompuServe B and B+ finally work. Thanks
to CompuServe Munich for the friendly
support.

Scripts run a lot faster now.

Z-Modem Autostart works fine now when you
are using the internal z-modem - even if
the terminal window is in the background
(lots of Mag!X users asked for that)

After a file transfer the correlated
terminal window will top automaticly.

Z-modem Upload got lots of faster. TT->TT
runs at 15000cps (under Mag!X 2.0)

Mouse interupts are disabled now when enabling
the box: 'No Multitasking' during file trans-
fers.

Multiple-file up- or download will get a
better display now in the transfer window.

Crazy Sound will now cooperate with CoNnect
and vice versa.

You can use the mouse in online editors.

The ALT key becomes more emacs19 friendly.
M->, M-< and M-C-x finally work.

The new hs-modem is supported. Users
not able to install the new hs-modem due to
a lack of english docs should at least
remove the old hsmodem from their auto-
folders as this one will bomb CoNnect.

Transfer priorities became flexible. Windows
are more easy to use when transfer is in
progress.

'Z-Modem rename' changed! Now the old file
will become renamed. The received file with
keep it's name.

get, getkey and waitfor got a new parameter
(-c) to enable carrier checking in these
commands.

>Lastly, is the fax option for 2.50 just for Zyxel modems (I hope not,
>I'm already mad that I can't use the answering machine stuff--looks
>awfully cool).

As I understand it, the 2.50 support will just be a front-end for using
the GNUfax software, so if GNUfax only supports the Zyxel modems, then so
will CoNnect (being a Supra user, I hope that this is not the case!).

41. HD driver problems

Newsgroup: comp.sys.atari.st
Date: 1994-01-01 22:55:00 UTC
From: rickard_troedsson@troed.ct.se
Message-ID: <2d25ff46@troed.ct.se>
Source record: 195992

Hiya all, anyone out there with knowledge on HD-Drivers?

I have a problem ... 2 years ago I bought a Protar Progate HD, and I'm still using its SCSI interface and the Protar HD-drivers ... but since support seems to have vanished (I have v4.04) I want to switch to AHDI. (I'm told ICD Utilities and the Protar SCSI interface can't cope)

Problem: The Protar uses the bootblock for its driver .. no files on disk ... and AHDI doesn't seem to give me the option to "Replace driver" ....

Can I switch driver without having to re-format all my harddrives? (not possible - no backups ...)

If so, to what? I want the drivers to be well known and supported though .. :-/ (Preferable AHDI)

Help very much needed!

] CYBERPAINT doesn't work on TOS > 1,6* :^(((

Works fine on TOS 1.62

I can't think why Cyberpaint 2 shouldn't work on new TOS's, It
doesn't do anything terribly fancy.... Of course, a lot of programs
that don't are non TOS portable....

It's a pity Atari hasn't distributed TOS 1.4 (Disk version) as public
domain. Then people could increase compatibility a bit....

Mind you, I've got a IMG loader, but the only way I've got of getting
the IMG's onto disk is with WINX, which insists on modifying the
data first, which confuses the loader no end! (e.g. it doesn't work!)

There is a program somewhere which will just do a straight dump of
the ROM's onto disk, does anyone know where I can get this!?

44. Wanted: ST BASIC, True vs Hisoft vs GFA 2 or others?

Newsgroup: comp.sys.atari.st
Date: 1994-01-01 23:20:06 UTC
From: ocia@tekig5.pen.tek.com
Message-ID: <13017@tekig7.PEN.TEK.COM>
Source record: 195993

All this is for a mathematician friend of mine who solves problems for me.

I am looking for a BASIC that is faster than ST BASIC at doing floating point.
(faster in other areas would be ok too)

Not being TOO different from ST BASIC might be an advantage to port some of
the work done in the past.

I have been offered TrueBasic, Hisoft Basic, told about the free GFA V2.0 Basic.
Is one of these considerably better than the others?
Or does someone have yet another Basic that would have advantages?

Someone did tell me there is an old pre-commercial version of Matlab for the ST
on a machine in Germany, if there are any other mathematically inclined folks
out there. And then there is Derive (for MSDOS) that will run under PC-Ditto.
Educational versions of that are VERY inexpensive and Derive is about the best
thing I have seen to do simpler forms of symbolic mathematics.

please reply by email if at all possible
thanks
ocia@tekig5.pen.tek.com

In addition to the LAN port and the standard ST Modem1 port, the MSTe
has a Modem2 and Serial2 port which give up to 158K bps.

ok, here goes. i have a discovery cartridge (from happy computers) which supposedly allows me to copy anything under the sun..... i purchased it about 3 years ago so i have no idea how it works on newer software (seems as though i've been out of the loop for a while)

anyways, since i purchased a new computer, i don't need this any more. is it worth anything and if so, is there anyone out there who would like to purchase it? i paid about $150 for it back then. i did purchase it direct from the company, so i have all original software and docs, etc.

e-mail responses/offers to rswanson@mines.utah.edu

It'll work fine if you use ATari Utils to boot. Only thing is it takes
almost 1.5minutes before you hit the desktop (or autoprograms). Its
really wierd, but it sits for about 10seconds, then the Atari booter comes
up, then it sits again for a few seconds, then the IDs are shown and your
on your merry little way... ICD should be able to cut that time down by
half if it doesnt pause before scanning IDs. I think it tries the IDE
again...

Well.. I formated my newly bought Seagate ST1100 with ICD Pro Utilites..
Then i simply installed the AHDI 4.04 driver instead of the Icdboot.sys file..
Worked like a charm.. But there can be a problem with your Protar having the
boot in the bootblock and not in a file.. hmm.. have you tried to install an
AHDI driver on your harddisc..?? What happens..? (I guess it still reads the
bootblock eeehh??)

Glad to be of assistance Dave. Glad you like the sig, I keep thinking of doing a smaller version, but there are limits as to what you can do with ASCII!

BTW I've heard of a program that can take a picture and turn it into the nearest ASCII equivalent, have you seen it at all?

It would be appreciated if Don could give some pointers on this as I always use BMAPFIX as well as FPATCH2. I also use FOLDRFIX set to 40 folders although I'm not sure it's needed or not.

BTW whilst talking about AUTO programs, should GEMRAM, W!nx, and SH_BUF go at the front of the AUTO folder? At the moment I've got GEMRAM and W!nx just after XBOOT, and SH_BUF at the end of the files.

Ok....I wouldn't go that far. Any Joe Moron can do this job....don't bother spending your hard earned money on this...

>Two notes.
>
>1. DEATH WARNING! DEATH WARNING! Monitors can hold a lethal charge for
>some time EVEN WHEN UNPLUGGED. There is some serious high voltage in there.

>thingy on the back of the CRT).

True True True.....If you don't have a plastic screwdriver, I would recommend getting one specially designed for turning pots. It is a handy tool to add to your collection.

However, if you don't have one, just take a (long [narrow]) neck) screwdriver, flat head, and stick insulation around it.....this is what I did....worked great.

>2. In some sense, brightness and focus are synonymous with monitors. Thus,
>if you tweek up the brightness internally, you will probably screw up the
>focus. You could probably diddle with the other pots and make it acceptable,
>but the only real way to do it is with an oscilloscope and a manual for that
>particular CRT.

NO No no! Don't worry about this.......remember, this is an Atari monitor. We are not talking about high quality delicate circuitry here, the made in Taiwan sticker really says it all.

Just go in there (with you monitor ON -- be careful so you don't kill yourself) and start moving pots around. Use you head when you do this, don't move pots

that you KNOW won't fix the job: You will be able to figure it out (IE, the pots on the picture tube).

SIMPLE RULE OF THUMB: If it makes you picture better, continue.
If it makes you picture worse, turn it back.

Remember, be careful....

>I don't mean to disuade you from this strategy, I only wish to clarify that

Who would want to go above 9600bps without CTS? That seems pretty
silly to me.

>Serial 1 is only on TT's

You aren't missing much. It also has a 19.2kbps max.

>Serial 2 has all signals, and are much faster (this is THE ONE to use)
>
>There also is a RS-422 LAN connector (very fast, Appletalk compatible)

This (if I remember correctly) can only be used if one is not also
using Serial2. Is this correct, or was that Serial1? BTW, if it is Appletalk
compatible, does that mean it is lacking hardware handshaking like Macs?

The only problem is that the Falcon check if there is any IDE drive *BEFORE* it checks if you have any SCSI devise mounted, this takes about 10 - 15 secs, you can live with it.... I didn't, I bought a 20M 2.5 inch IDE...

The answer to your question should be:

No problemo!!!

What patches do I need so that I can upload using RTS/CTS.

As it stands, as soon as I try to send anything at high speed, the
modem decides to hang up. (This happened with the 9600 i used to have,
).

I've got an STE. What patches do I need so I can send anything
with a higher-than-plain-2400 modem!?

(Such a STUPID bug, I can't believe Atari was so stupid to leave it
in after TOS 1.xx, are their TOS programmers thick or something!? And
why don't they give the users these patches with the machines!?)

I've tried most of the patches, but they make no difference at all.
(I haven't tried Serial-Fix with the CPX, as I don't have a Hard-Drive
waiting for X-Control and the CPX's to load is a nuisance, so I never
use it, but I have tried it without the CPX. WHy isn't there an .ACC
version of the RTS/CTS locking program (If in fact, it does work!))

Uploading at plain-old 2400 is horrible. (I've only got MNP-4, but
due to this bug, I can't even upload or quote text with that turned
on, as the modem hangs up as soon as I try to do so!)

I'd like to sort this out, as High-speed modems are becoming so
affordable, I may have to buy one. (Even though there is only 1 BBS
I would use it with, which has stuff-all new files being sent to it....)

: ICD's Pro Utilities (ver. 6.2.4) allows you to skip IDs scanning.
: Sorry Kevin, but we have to bring the public up to speed on this issue.
Let me clarify a little more. If I like run ICDBOOT.PRG from the desktop
or from the Auto folder on A:, it sees the drives and works fine. The
problem is if I use HDUTIL to set the boot drive, and select C: (my 15meg
SCSI partition since i have no IDE) It comes back saying "Auto Boot Error!
None of the partitions on your Hard drive support autobooting" (or damn
close). I even tried my 50megger that came stock in my old Mega/STe, and
it HAD the boot sector already on it, came back with the same thing. I
told Tom (GEnie) about it and he said that ICD will fix it.

But the Atari Utils work fine (booter is 6.061 I beleive)

Works fine on my 16mb Falcon, even works great with the ScreenBlaster, and worked with MTOS the last time I ran MTOS... TOS 4.04 if that will make any difference, and an 84mb drive.

I believe a program called AHDICONF wil allow you to choose which ID's
to search with AHDI. However it is a german program and I have not
been able to figure out many of the configuration options. Maybe if
some kind German speaking Atari Friend would translate the docs... :)
I found it on an European FTP site (ftp.uni-kl.de)
I learned this from a posting October 14, 1993 by Uwe Seimet, maybe
he could be more helpful.

>That doesn't make sense, since there's virtually no hard drive yet (no
>affordable one, at least) that drives the NCR chip to its limits.

The controller in the falcon is limited to around 1.1M a sec, _flat_strap_,
depending on various annoying timing considerations. (NCR5380)

There are plenty of drives around that will happily go faster than this.
If you want an example, say 'seagate' and 'barracuda' to any halfway
educated disk reseller, and watch them drool. - And there are plenty
of cheaper ones too.

I have a disk here that I can get about 990K/sec through on the TT - I know
for a fact that it's the TT slowing it down, because I have had the disk
running at around 1.3M/sec on other hardware. It's nothing special, and
about 5 years old.

There is no 'speed' for SCSI-2. SCSI is (in it's simplest form, don't bother
telling me about synchronous mode, I know) asynchronous - the speed of a
transfer is dependant on the hardware at both ends, and their interaction.
The spec defines signal timing which limits the upper speed limit, no more.

Yes, SCSI is _much_ better than IDE - with IDE the processor has to shift
every single byte itself, which is not a very rapid way of doing things.
(yes, there are IDE drives appearing that actually seem to grok DMA, but
they are few and far between if you actually want it to work as per spec)

>Roland.

"Argh," quoth he - a little knowledge is a dangerous thing.

Cyberpaint does some "illegal" things in order to speed up the screen display
and allow a quicker delta compression...direct screen write...dismissing the
atari guidelines completely <g>.

It makes Cyberpaint one of the fastest and powerful animation tools around...
however only for 320x200 in 16 colors.

Oh well..can't have everything...

Cheers

People : I've been doing a bit of a roaring trade in unofficial german-english
translations of late (currently working on SCSItoolJR fwiw).

If you have Your Favorite Program (or something that just may be...) let me
know about it, and I'll see what I can do for you.

Authors - if you have a german-only program, and you're afraid the world will
laugh at your english, why not toss it at me, and laugh at my german?

If you're trying to get something as widely popular as possible, having
an internationalised version is a Great Thing!

(and if you're not sure how to make it easy for me, look at the way Upoint
is done - _all_ of the useful strings are in the resource file - sheer
heaven, because I can _change_their_length_ without breaking it!)

> flare and show us the way!

Hello!

I'm using the ka9q-package on my Atari. The (working)
package is available at ftp.tu-clausthal.de (139.174.2.10)
/pub/atari/telecomm/tcpip/sticp.lzh. Access via FTP,
FSP (port 21) or email ("mail-server@ftp.tu-clausthal.de").
To get a more complete documentation get also the archive
ka9q_st.lzh.

I will try to give some "samples" on how to setup ka9q.
Remember to change hostnames/ip-addr/gateways etc...

Sample configuration:
* put all the stuff in a dir "net" in one of your root-dirs
* create inside this "\net"-dir the following dirs
- finger
- mail
- mqueue
- rqueue
- spool
- tmp
* customize your "\net\autoexec.net" file, sample:
```
#
# ...your internet-address
#
ip address [139.174.8.2]
#
# ...your hostname
#
hostname hiwist.rz.tu-clausthal.de
#
# ...configuration of MIDI interface
#
attach asy 3 1 slip midi 4096 576 31250
#
# ....configuration of SERIAL interface
attach asy AUX: 2 slip sl0 4096 576 19200
```

```
#
# ...link speeds (only need if differ from the one
# selected in the attachh cmds)
param midi 31250
param sl0 19200
#
# ...routing table
#
route add default sl0
route add thilo midi
route add claas midi
#
# ...time-to-live value
#
ip ttl 50
#
# ...loggin to which file?
#
log D:\net\spool\net.log
#
# ...delete old (smtp-)locks

maxlet 100
======================================================================
* optional create the following files:
- alias (containing your mail-aliases "alias email-addr" once per line)
- finger\userid.txt (text displayed when fingering userid)
- autoexec.bat (or whatever your startup-script of your shell is)
- mail.bat (to call the 'bm' and return to ka9q) with the following lines:
D:\NET\BM.TOS %1 %2 %3
exit
(this way you are able to start bm with "!mail email-addr" to send
or "!mail -u userid" to read)
* other hints:
- the hosts inside your "autoexec.net" file must be listed in "hosts.net"
- to track down problems while connecting to other sites use the "trace"
cmd...
- the slip-connection must be started before starting ka9q (or within
ka9q if your shell supports direct AUX: access to dial and start slip).
- don't rely too much on the docs (a lot is not working in the Atari port)
- ask your local telecomm/unix-guru for further help

I hope that's all. This should be enough to setup your own site...

Bye,
Wolfgang.

100. New GCC/mint libs - need aid!

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 06:19:14 UTC
From: kgelner@nyx.cs.du.edu
Message-ID: <1994Jan3.061914.17175@mnemosyne.cs.du.edu>
Source record: 195853

Hi!

I just tried installing the newest version of GCC and mint libraries on my Falcon. I did this by merley extracting all of the new GCC and mint libraries over the old versions.

Now, the problem. Whenever I try to compile even the smallest hello world program, GCC does something for a little while, then stops - but no output of any kind is produced. I don't get any a.out, or even a .o file if I use -c.

When I tried to compile a larger file, it seemed to work on something for a while, but once again quit with no output, no error messages.

I seem to recall thsi problem comng up before, but do not remember the answer. My old GCC setup worked OK, so this is all very strange. Does anyone know what might be the problem? I'm pretty sure my env vars are in order... did something change in the new release?

Thanks,
--

Actually, Aaron does indeed want to add Fax support in v3.0...

Now, if I could find the specs for RIP, I think he could be persuaded to add
that to a future version as well. <g>

Source record: 195673

Hello,

The news system was not working the last time I posted this, so the message never got out.

I am looking for a TT/Falcon user (with MultiTOS/memory protection) to test the new version of MasterBrowse. Once I know that the program will run on the Falcon/TT with the low-level changes I have made, then I can go ahead with my other plans to _really_ improve the program. The beta-testing (at first) would simply consist of running the program, and following a very short checklist.

Beta-testers receive a FREE, registered, optimized, personalized version of MasterBrowse (as well as some other programs) VIA electronic mail.

If you want to do this (and it would _really_ help me out) then just reply to this message and say so. BTW, I will of course be happy if more than one user replies (the more the merrier -- up to a point)...:)

No I havent seen it Darron - The support for the Falcon is vertually non-exsistant over here (Australia - I was one of the first 20 people to get one in Western Australia)

BTW do you know if Eagle Sonic 32 (32 Mhz accelerator) is available yet - so how much is it and where can I get it from (mail order)?

Also - do you know of any _really_ good demos that show of the Falcon to full effect - if so where can I get them (ftp)

Cheers,
Dave Cook (davecook@multiline.com.au)

I got a patch (probably from atari.archive) that is called HD_FDC.PRG in
its uncompressed form and works quite nice. I've been using it for quite
a longe while now and never had any problems with it. It sits in the
AUTO folder and runs directly after my BootSelector and before anything else.
(It works together with all sorts of vector benders (digivec,beep, ...)
and even works fine with MiNT running after it. (I never checked if MiNT
actually needs it, but ...).

Hope you get a working patch, the 2ms noise is not nice.

Michael

THANKS A LOT ;-) ;-)

108. Re: STraight FAX 2.0

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 08:56:29 UTC
From: mjuschke@tartarus.uwa.edu.au
Message-ID: <2g8mjt$ft7@uniwa.uwa.edu.au>
Source record: 195864

Hi,

some months ago I bought a copy of STraightfax that was said to work
with my Maestro 9600XR Data/Fax modem.

Faxing to the machine in Dad's office (and receiving from it) always
worked fine.

The office machine worked fine with all sorts of other fax machines,
too.

Recently, I had a friend send a fax to my computer, and
the receiving seemed to work fine, except that when I looked at the fax,
nothing was there, not even the usual header (time, number etc).

Preveiously the same friend had sent something to the office machine and
it had worked. Since there is no header, she did not by accident send an
empty page (ie wrong side).

Testing the program again with the office, I discovered that the baud
rate dropped to 2400 with this (old) machine, while it was 9600 with the
friend's machine.

Has anybody an idea what could be wrong ? I have read somewhere, that
new fax machines usually run at 9600 baud, and that some have trouble
communicating with other machines (modems?).
Is it possible that my MegaST 2 (7 years old) cannot handle 9600 baud,
even though it appears to be working during transfer? (In comms mode
I can only run 2400 baud anyway).
Or does the STraightfax stuff up ? I cannot remember the version, and
running it to find out would kill my connection right now, but it says
on the pack that it runs with ST/TT/Falcon030. It supports SendFax,
ReceiveFax and Class2 modems.

Any suggestions, oppinions ? Please e-mail, as I might not be on in time
to see any follow-ups before they expire.

Thanks
Michael

#> I tried several "freely" (in quotes because of shareware) available
#> backup programs for backing up my TT's harddisk, but none of them
#> works satisfactory. Here is a summary:

[C-k C-k C-k ..]

#> Summary: There seems to be no useful backup program available on the net.

Though I'm a 100% atari-fan, Ive had to do some backup on PCs (sight),
none of mine fortunatly.

But I've been using a very well-made arcers-program called ARJ. It contains
so many features and commands that EVERYTHING is possible. Like packing
for a specified size (eg. 1.44 mB), executing OS-commands or batchfiles
plus so much more.

So, as you might have guessed, Im gonna ask

HAS IT BEEN PORTED FOR THE ATARI ?

(cross here) ___ YES

___ NO

if yes, where can it be found.

And by the way, Happy Newyear everyone.

Sincerly
Lars Frandsen

I would until you have the money for a laser. The quality is so much better,
I speak from experience. I bought a HP Laserjet 4L recently ($600) which does
a much better job as the Olivetti JP350S (Inkjet) I had. I assume you are
printing scores, well I am doing the same with ScorePerfect and Calamus S.
Not only is the HP much better it is also MUCH faster than the inkjet.

Just something to think about...

Greetings from the Netherlands,
Marcel.

111. PT_SRC3T now available at your favorite site

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 09:47:43 UTC
From: d3marten@dtek.chalmers.se
Message-ID: <d3marten.757590463@dtek.chalmers.se>
Source record: 195866

PT_SRC3 goes TRASHY .....

I have uploaded my new version och PT_SRC3 and since I have
added TRASH mode it's called PT_SRC3T.lzh and I have uploaded
it on following sites:

ftp.uni-kl.de
athene.uni-paderhorn.de
faui43.informatik.uni-erlangen.de

What is PT_SRC3T then ?

The archive PT_SRC3T.LZH contains the full sourcecode for a
TRUE 50kHz replay routine every effect in PT2.2 supported.
The new in this version is TRASH mode which is a really useful
technique. It's good since you don't have to count on the
replay's maxtime (which in case is somewhere around 34%
(sigh,it's too much)) but on the mean time it takes (which in
this case is 26%-28%).

Bugs (NO!!) , Suggestion , Questions , DONATIONS :-) , your
girlfriend have breaked up with you and you need someone to
talk to , or whatever then mail:

>>> d3marten@dtek.chalmers.se <<<

That's all folks

It should be much easier to parse. Remember that assembler output of compilers is not intended to be read by human. The version 2.2 of gas can handle both syntax variants (even mixed).

|> bios.c -o bios.o
|> bios.c: In function `bconstat':
|> bios.c:136: unknown register name `memory' in `asm'

You should get at least gcc 2.4 for this error messages to disappear.
If you prefer to wait for gcc 2.5, you can just define the name
AND_MEMORY in $GNUINC/osbind.h to be empty during the mean time. The
"memory" pseudo register name apparently was introduced after gcc 2.2,
but there is no way to distinguish between gcc 2.2 and gcc 2.3
(nowadays we have __GNUC_MINOR__). The warning messages about the
uninitialized variable should go away after the change.

|> BTW, do you need to put something in setenv to just be able to type
|> make in a directory so that any file named makefile is automaticaly "make"d?
|> Right now, I have to do the make -f to get it to run.

Apparently your version of make is broken. It should look first at
"makefile", then (if not found) at "Makefile". The GNU version always
looks first at "GNUmakefile", and then trys the other names. All file
names are tried in the current directory.

Probably pagestream is getting low on TT memory and thus gets the memory for the print buffer from ST memory. (A program configured for ST memory will never get TT memory with Malloc(), but it's possible the other way round.) I don't think that there is any other possible explaination, since the ACSI-DMA cannot access TT memory (due to its 24 bits bus).

I think this should be a macro in dirent.h. Probably gzip is not
configured correctly (btw. what version of gzip are you compiling?),
or the GNUlib is not up to date with MiNTlib.

Well, you never know... The TinyTurbo030 boards for the Mega STE are a solderless installation (you just remove your CPU and snap it into the CPU socket, from what I understand). They also retain a 68000 on board for compatibility switching.

What kind of protocoll do you want to use? Normally a PC under DOS (or Windows)
serves NETBIOS (I think). Uner some UNIX OS it will use TCIP/IP.
There are people working on an TCP/IP implementation for MiNT, also a networking
file system is worked on.

Regards,
Ulrich

|> for the 550C? Much software that supports color?
|> Fred Harris

GhostScript does!
(2.5 supports the Deskjet 500C and the new 2.6 supports the 550C
(not official released, but the beta i have runs without problems))

GemView 3.xx will support color, there is a experimental driver
in the 3.01 distribution (including source)

Calamus SL and S supports color

Signum!3.3 is supposed to support color

There is a paintjet GDOS driver which may work with the Deskjet.

Word Writer II isn't public domain, but it should be really cheap by
now. It's WYSIWYG (but WYG is based on dot-matrix printers, not
multi-font laser printers), has a good spell checker, and (dun dun DUN!)
an online thesaurus (something I've seen in no other ST word processor,
but I've heard exists in some). Not bad for c. 1988 stuff. Works quite
fine on my system, and I've been using it for years (it used to be a 1M
system; it works fine on .5M systems too) in colour and monochrome.

I'm pretty sure the only thing you could use is the serial port. The
Atari platform is severly lacking in networking software, even if some
models have the hardware.

Hi, there!

Due to public pressure, a new GEMINI-release has been published on Dec 31.
Since it does not yet include documentation files and appears to be buggy,
it is called GEMINI 1.99, which is at least better than nothing, and even
better than 1.21. It can be anonymous FTPd at ftp.uni-paderborn.de
(atari/tools/gemini).

Have fun

Gemini 1.99 -- a prerelease of Gemini 2.00 -- has been posted to ftp.uni-muenster.de, pub/atari/Gemini. You'll need gmni2.tos and mupftl01.tos, both self-extracting ZIP files. Note that there's currently only a german version and most of the docs don't exist yet.

Gemini 1.99 supports MiNT, MTOS and Mag!x and has a 99% POSIX compliant shell.

: Again, useless (or a serious pain in the butt) for running multiple
: programs (remember that little thing... MultiTOS; and Geneva), not to
: mention the fact that you can't yank things out of the cartridge port
: while the machine is on...

When your prom in your cart port has a valid rom drive configured on it
the rom disk will boot before the floppy or any other device. So yes it could
be if it was in the boot rom. Having said this, there are many ways to
discourage people from copying things like games etc but hardware is only
as Chris says a pain in the butt.

Remember also a Mac 128k rom set will also go in a 4x32 rom cart and this
can also be banked switched so you have mac roms and then a few things in
your rom drive.

Boy I miss the Atari.

Here is a bit of fun on my Sun SPARC .. this is the boot drive

----> >dmesg

sd0: <SUN0669 cyl 1614 alt 2 hd 15 sec 54>
sd3 at esp0 target 0 lun 0
sd3: <Atari cyl 3712 alt 2 hd 15 sec 38>

People love my Atari drive in the Sun box here :) A 1 gig Atari drive
(must be true it on the sun [big grins])

Happy New Year people .....

I will soon release a new version of AutoRaise, probably rebaptized to
something like 'GEM Gadgets', which includes, among other things, the
possibility to put bitmaps, GIF images and animations on the root object
of the desktop tree. Expect it to be out in, say, two months. The
program will be freeware and requires WINX or Falcon TOS.

It will be posted to or announced on comp.binaries.atari.st.

Message-ID: <368@vercors.frec.bull.fr>
Source record: 195578
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'd like to run a GEM program at boot time (as are run programs in the
auto folder). I have read that newer versions of TOS can do that but
I have got a MegaST2 TOS 1.2.

I have been told that AES was not started when executing programs from
the auto folder, so this should not be the right place. (Perhaps is there
a way to easily start the AES ?)

I have tried to run the program using a Pexec call from a very simple desk
accessory I have written, but this failed... The program didn't execute and
the accessory didn't work any more: I got the desktop without its menu item.

Any ideas?
Thanks in advance for your help!

Hi Folks,

I must say that I was "blown away" this weekend. My friend
invited me over, the day after New Years, and mentioned that
he had some new Atari games.

Well, I expected to see them on his ST, but he said that they
were Atari games, available on the PC. I expected some lousy
translations, but NO WAY...

My eyes popped out as I witnessed what must be a PORT of the
old(er) vector graphic games, TEMPEST, BATTLEZONE, and ASTEROIDS
running under MS-Windows. THEY MUST BE A PORT AS THEY PERFORMED
EXACTLY AS THE ORIGINALS.

I am syill amazed... He bought all 4 (Centupide included) for
$24, under the title Microsoft Arcade...

Jaw still open to floor,

John Miskinis

Darek may be reached ar darekm@microsoft.com. I am a current user of the Gemulator
and have been very happy with it. The emulation is very good, and even sound
is somewhat emulated if you have a sound card for your PC. The biggest problem
that I have run into is that I am unable to run the majority of my copy protected
software, and the lack of support for the MIDI cables and joysticks. (the next
version of the gemulator due in the next month or two will have joystick
emulation). E-mail me if you have any specific questions on the gemulator.

139. games

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 16:37:24 UTC
From: mdekker@fwi.uva.nl
Message-ID: <2g9hk4$1an@turing.fwi.uva.nl>
Source record: 195886

hi folks,

I want to buy one or two games for my st. I am interested in good
role playing games. Of course I played dungeon master and Chaos strikes
back. I want a big game (in the sense that it takes lots and lots of time
to complete) with neat graphics. The game should be difficult (as I am
not a beginner!) with lots of puzzles (so not only hack 'n slash). For
example I am thinking about one or two of the following games:

Ishar I & II
Amberstar
Legends of valour

If any of you guys have played these games, please tell me about it. Also
if you have other games you recommend, please let me know!

greetings,

Martijn Dekker

--Mike
```

143. FOR SALE: Atari ST Software

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 16:58:43 UTC
From: mcalear@eng.amdahl.com
Message-ID: <d1gB02wW59mA01@JUTS.ccc.amdahl.com>
Source record: 195891

I sold my ST a year ago, but I still have a lot of the software. Most of
it is on SS disks. Here are the titles I have:

Flight Simulator II
Mean 18 Ultimate Golf
Barbarian (by Psycnosis)
Gauntlet
Chessmaster 2000
Balance of Power
Gunship
Sentry
ST Karate
The Music Studio
Sub Battle (by Epyx)
Starglider
Championship Wrestling (by Epyx)
Wargame Construction Set
BB System (by Quantum Microsystems Inc.)
Blockbuster
Flash
Defender of the Crown
Hex

I want to get rid of all this in one package. I also have several
"copied" disks (I got everything from a friend) that I will include. If
you have problems with this, just erase everything and get a bunch of blank
disks at no extra cost.

Included in all this is a box full of manuals.

I will be accepting offers for the next week or two. Highest bid gets it.
If no one bids, I will give the stuff away.

Buyer pays shipping and c.o.d. charges. Email is preferred, but if you
can't get a hold of me, call (408) 992-3181.

144. uqwk

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 17:24:45 UTC
From: donm@ucon.gun.de
Message-ID: <1994Jan3.172445.8213@ucon.gun.de>
Source record: 195713

Greetings fellow mailers and fellowettes mailerettes!

Is anyone out there familiar with UQWK? I'm having a very hard time
wrestling with the thing. (Keeps pinning me down...) Two specific questions:

- How do I get UQWK to take my reply file? So far, I would do this:
uqwk -Rreply.dat
where "-R" is the reply flag and "reply.dat" is a file living in my
home dir. However, uqwk then responds impertinently with: "file not
found"... or some such.
I did try various file/pathname permutations but no luck.

- What's the exact layout of the reply file, anyway? Maybe uqwk does find
the reply file but doesn't like its contents and it responds with a
wrong error message (just for fun...).

Oh yeah, the QWK file layout would help too, although I've decoded most
of it with a machine language monitor... ($E3 for a line feed!? Sheesh!)

As always, thanx muchly!

Don

P.S. to pathological pedants: I'm doing this on the Falcon so it does
belong in this newsgroup! Sorta... So there!

>24 bits bus).
>
>--
>---
>Andreas Schwab "And now for something
>schwab@ls5.informatik.uni-dortmund.de completely different"

That's interesting - didn't know it would work that way. I did have
more fonts loaded than normal so perhaps as you suggest, the TT
memory was sufficiently "used up" that when pagestream needed a buffer
to image the page, it ended up using ST memory.

Is there any sort of monitor (particularly under multitos, perhaps
an ACC) that would show how much TT and ST memory were in use? Sort
of a dynamic memory map showing what programs were using what memory
blocks?

Also, could someone enlighten me on the "TPA" question in the TT flag
setting program? It asks about "running from TT memory" and "allocating
from TT memory" (both of which I turn on), but then also asks about
"TPA size". The default is "128" and increases from there... No
documentation came with the little FLGSET utility I'm using.

Thanks.

As usual, please send additions, corrections, flames etc. to
patrik@p2.stacken.ct.se

I'm also looking for GIF's to cover every system, but so far I have only found
a Jaguar GIF. Any others available via ftp?

```
================================================================================
"The Hithhiker's Guide to Atari Computers and Consoles" Rev.02
================================================================================
```

-= ATARI VIDEO GAME SYSTEMS =-

Sometime in the almost forgotten mist of history, a wizard by the name of
Nolan Bushnell invented the first video game known as Pong and created the
American company with the peculiar name Atari. Later the tradition was
carried on with the popular 2600 VCS, but eventually it was doomed to fail
in the fierce competition with Japan. That was until one day in the year
1993, the day of the Jaguar.

Note: The word Atari is Japanese and comes from a term in the game of Go.
The company was originally named Syzygy but it was quickly changed.

```
Year____Model___________RAM_____________Engine & Speed_______________________
1972-74 Pong 7400
1975 Video Pinball 6502(?)
1976 2600 6502
? 5200 6502
1984 7800 6502
? 65XEGS 64KB 6502
1989 Lynx (handheld) 64KB CPU 6502 ~4MHz
"Mikey & Suzy" 16MHz
- Panther (never released)
1993 Jaguar 2MB CPU Motorola 68000 13.3MHz
GPU RISC "Tom" 26.6MHz
DSP RISC "Jerry" 26.6MHz
```

-= ATARI 8-BIT COMPUTERS =-

Microcomputers dropped like a bomb in the late seventies. Every
company with some self respect wanted to be first on the ball
but few managed to do so well as Atari did with their powerfull
8-bit series that prospered for nearly a full decade.
While other computers failed and quickly disappeared, Atari
managed to improve their models and sustain the backlash after
the early years of unlimited expansion. But Atari was bleeding
badly. The one billion dollar company almost went under in the
struggle, something that would later open the door for the next

person to enter our story...

```
Year____Model___________RAM_____________Engine_______________________________
1979 400 16KB 6502
1979 800 48KB 6502
1983 600XL 16KB 6502
1983 800XL 64KB 6502
? 1200XL 6502
? 1450XLD 6502
1985 65XE 64KB 6502
1985 130XE 128KB 6502
```

-= ATARI TOS COMPUTERS =-

Jack Tramiel, the holocaust survivor that once carried Commodore
to a top position in the industry, took one quick glance at his
former antogonist and then leaped to Ataris rescue. Gathering some
of the best talents he could find, the company began immediate work on
the ST. The astonishing result could be seen some mere six months
later. The competition paniced, fainted, woke up and paniced
again. Tramiels number one concept "Power without the Price"
dominated the home computer market in Europe for several highly
successfull years in the mid to late eighties.
Will the Falcon pick up where the ST left? Only time can tell...

```
Year____Model___________RAM_____________Engine & Speed___________TOS Rev's__
1985 520ST 512KB CPU Motorola 68000 8MHz 1.0
1986 520STM 512KB CPU Motorola 68000 8MHz 1.0
1986 1040STF 1MB CPU Motorola 68000 8MHz 1.0
1987 MegaST 1,2,4MB CPU Motorola 68000 8MHz 1.02,04
1988 520STFM 512KB CPU Motorola 68000 8MHz 1.02,04
1988 1040STFM 1MB CPU Motorola 68000 8MHz 1.02,04
1989 520STE 512KB CPU Motorola 68000 8MHz 1.06,062
1989 1040STE 1MB CPU Motorola 68000 8MHz 1.06,062
1990 MegaSTE 1,2,4MB CPU Motorola 68000 16MHz 2.05,06
(optional FPU Motorola 68882 16MHz)
1990 TT030 2-26MB CPU Motorola 68030 32MHz 3.01,05,06
FPU Motorola 68882 32MHz
1992 Falcon030 1,4,14MB CPU Motorola 68030 16MHz 4.01,02,04
DSP Motorola 56001 32MHz
(optional FPU Motorola 68882 16MHz)
```

Note: There was a 260ST (512K) in Germany (some say even a 130ST but it's
doubtfull if it were ever marketed), and also the 520ST+ (1M).
The first ST's had to boot TOS from disk.
TOS versions 1.02, 1.04... are sometimes refered to as 1.2, 1.4 etc.
STF = internal floppy, STM = RF-modulator, STFM = both.
Atari did a Unix port for the TT but it was later abandoned.
STE's use either 256KB or 1MB SIMM's thus giving a total of
0.5, 1, 2 or 4 megabytes of memory.

-= ATARI PORTABLE COMPUTERS =-

1989 STacy 1,2,4MB CPU Motorola 68000 8MHz 1.04
1990 Portfolio ? ?
1991 STBook 1,2,4MB CPU Motorola 68000 8MHz 2.06

Note: The Portolio runs DIP DOS, a MS DOS 2.11 clone.

-= ATARI RISC WORKSTATIONS =-

1988 ATW 4MB + 1MB video (plus 2MB for each Transputer)

The "Atari Transputer Workstation" features a MegaST with enhanced
graphics and one or several Inmos T800 at ~20MIPS each. The Transputers
are able to work in parallell to increase performance even further. The
system runs a special version of Unix called Helios.

There is a .DL file player somewhere. It's called MDL (for Mono-DL)
and works only on mono monitors. It's by the same author (I think) who
gave us the Mono-only GIF viewer. It should be available at
archive.umich.edu.

148. FOR SALE: 1040STf, 2.5 megs RAM...

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 20:25:32 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.94Jan3152532@wpi.WPI.EDU>
Source record: 195895

vintage 1987 1040STf, seems a bit flaky... There is a problem with the upper bank of RAM

With XTRA RAM 3D RAM upgrade installed. This board gives it 2 megs in the lower bank but keeps the flaky upper bank. With another 16 1MBIT DRAMS it would bring it up to 4 megs and eliminate the flaky upper bank. That should cost $50 or so...

I'm asking $150 for it. I'll include the original mouse.

Doesn't it also include Missile Command?

I was amazed when I saw that set up a local store. Using the mouse for Centipede sure beats the old Atari joysticks. When I get that package (maybe tomorrow), it'll be just one more step the 486 takes toward completely replacing the old 1200XL. <sigh>

I haven't seen a PC version of Joust that's as good as Atari's, yet, though. And I haven't seen ANY PC version of Ballblazer, one of the all-time greatest Atari games-- stunning graphics!

Anybody remember "AtariSoft", Atari's venture to sell versions of its games for IBMs, Apples, Commodores, and TRS-80s? Are any of those still around? It might be kinda fun to play a simple game of Frogger on the 486. At least I wouldn't need a CD ROM drive for it!

Does C't sell these gadgets already put together? Is the
magazine, or any hardware I hope that they sell available in the US?
Does it have an MMU socket? Since I use GCC alot, I would rather have
floating point support than general speedup. Does anyone know of an
very inexpensive way to upgrade an st to 68881 + tos 2.06? I seem to
remember something called a tos adapter board that only cost $20.

>It is a port of ka9q, which veered away from the PC version sometime ago.
>Where'd you manage to get binaries of ka9q that work from?

The KA9Q I'm using came of one of the conferences on CIX, which I don't think is actually an FTP site.

Its all set up for the DEMON internet service and I'm fairly sure they have an FTP address which has this program at it.

Its actual filename is NOS.TTP, but it is KA9Q as it is functionally identical to the KA9Q I have running on a PC (also using SLIP).

The main problem with both of them is the amount of memory they use. I've been trying to automatical ftp stuff between machines, but with the memory overheads, its hardly worth the trouble - which is why I'm looking for something similar.

Roland.

@CIX

162. Re: SCSI 2 hard disks ...

Newsgroup: comp.sys.atari.st
Date: 1994-01-03 23:54:03 UTC

Source record: 195813

>>AFAIK there are at least 4 different types of SCSI2
>
>May I suggest you go snarf the spec and read? 8)

Sure can :-) Yes I'm quoting of the top of my head based on what I've read in PC magazines. The point I was trying to make was that the SCSI 2 standard (whatever that may actually be - I've only got a SCSI 1 document) is different things to different people and just because a drive says its SCSI 2 doesn't mean it does everything in the standard.

The rest of my post was me just chancing my arm as nobody else seemed to be too interested in commenting :-)

>>That doesn't make sense, since there's virtually no hard drive yet (no
>>affordable one, at least) that drives the NCR chip to its limits.

No comment

>"Argh," quoth he - a little knowledge is a dangerous thing.

Sure is.

:-) (note lots of smileys)

Roland.

Lattice C support co-processors. The latest version is about 5.6.

GCC appears to have some support for one as well (judging by some of the
filenames), but I don't have a co-processor so haven't been able to try
it.

>version of the RTS/CTS locking program (If in fact, it does work!))

You don't need the CPX, that only allows you to lock the serial port
into RTS/CTS mode, without the CPX, just select RTS/CTS in the program
you're using that access the serial port...or the control pannel is it? Do
both and you'll be safe :-)

SW> I suppose the only other way to update ICD software if you can't call
SW> GEnie
SW> or ICD BBS is to send the disk to them every 2 months for an update!?

Yeah, I've wondered for quite some time why ICD can't use PATCH or DIFF files on their PRO series of utilities. I realize they can't just upload them to GEnie or the like since they don't require an ICD host to operate, but requiring me to mail in my master disk (and $10 I believe) for each upgrade is a little slack, since I was able to upgrade my old software (the non-PRO version) by just calling their BBS or GEnie.

Obviously there's not much else they can do to distribute new versions other than make you call a service. After all, if you bought an ICD host adapter, you're getting very powerful software for free... do you really expect them to expend more money for upgrades sent to you? If so, I'm sure the host adapter would have been much more expensive to begin with, or you'd have to pay for ALL versions of the software (not just the PRO series).

Lattice C supports a math copro. You should be aware though there are
problems with some STs and MegaSTs and the 68881. My FPU test in GEMBench
uses the auto-detecting library and fails on certain STs. This is a
hardware problem according to HiSoft.

Message-ID: <2gatut$b0u@charm.magnus.acs.ohio-state.edu>
Source record: 195819

The idea for the SLM to use ST memory for printing so Atari could sell a laser printer that would out perform other laser printer.
Also a few other things worth mentioning.

One, no memory in the Atari laser print (DRAM was expensive) keep cost down for the consumer.

Two, GDOS to make a Font platform that would not cost alot to change Font sets it is easier to add Fonts to software than make a new Eprom for postscript laser printer.

Three, why redraw the printed page again in the laser printer's memory. (Example the SLM 804 would have the 1st page printed within 10 seconds) Note: I would rather buy more computer memory than laser printer memory I figure I would keep the computer long than a printer.

Four, by an Atari GDOS (which is now SpeedoGDOS) saves you money ONE FONT System that can be used (this is dependent on developer cooperation) all software designed for the computer. ie. graphic, spreadsheet, or wordprocessor.

Raymond Collins

>The Falcon internal IDE drive...happens to be for notebooks or? This would
>mean that a 340 mb 2.5" IDE would cost a lot of money...

Considering the fact that 340MB for a 2.5" drive is state-of-the-art
(==Highend) you are talking BIG bucks for a drive like that (regardless of
whether it is IDE or SCSI). Forget getting 1$/MB on something like that.

The deals will be if you get a drive that everyone else has "outgrown"
like all those 20/40MB drives that apple used to make standard (now you can get
deals from 3rdparty dealers that bought up Apples stock of old 80 (100?)MB
drives - if there are any left...I know someone bought one of the 3.5" Quantum
LPS (Prodrive?) 40s last week). Perhpas someone will cut you a deal on 20s,
40s, or maybe even 80s that people are longer interested in having standard in
their machine, or maybe if you don't mind a used drive, see if people who have
upgraded their notebooks (not Apple's Powerbooks or Duos since those are SCSI
drives...) will sell you the old drives.

If you are worried about the size of the drive, then just make sure you
put just the boot-software in the C drive - .accs, MTOS/MiNT, CPXs, etc. I
doubt you have 20MB worth of Startup software...

Animations? That would be interesting ....

I don't suppose you would be able to make sure that having MTOS would
be sufficient for running this program (I have neither WINX nor a Falcon).

Thanks!

Perhaps Handshake output is CTS, and Handshake input is RTS (or is
that backwards?)? If so, would that make "*Transmit Data" == DTR, and
"*Received Data" == DSR (sp?) ?

>used in a DD drive. Formatting at DD must always be done in a DD drive!

That is true for 5.25 drives. *Not* for 3.5. The problem is that 360k
DD disks are 40 track, and 1.2M disks are 80 tracks (in the same space)
The problem is that the 1.2 meg drives write the thinner tracks even
when writing to a 360k disk. This means that even if the disk was formatted
on a 360k drive, it may *still* not be readable on a 360k drive after being
written to on a 1.2.

3.5 drives don't have this problem because both 720k and 1.44M disks
are 80 track!

>Unfortunately, MSdos does not support SS disks any more since 3.2...

Sorry, it *still* supports them on 5.25 drives. And if you use driver.sys
it'll let you do it on 3.5 drives.

It is normally assumed that you are using the proper *type* of floppy. If
you try using a DD disk in an HD drive AND FORMATTING IT TO HD LEVELS you'll
have trouble. But formatting a DD disk *as* a DD disk on an HD drive works
just fine. On a 5.25 HD drive, it'll even read ok on a DD drive much of
the time. On a 3.5 it'll always work ok.

>are wrong about the 3.5" part of the story.

Sorry, but the sectors a *inches* long. The heads are a fraction of a
millimeter long. They write just fine, and what they write is the proper
length. They are *designed* to work ok at both densities.

>(I don't know whether my statements are completely right either; but one
>thing I know for sure: formatting a 3.5" diskette at DD in a HD drive,
>sometimes results in a COMPLETELY UNREADABLE diskette for a DD drive!)

Then one of the drives is out of alignment! Or you formatted a disk
designed for HD as DD. That extra hole on HD floppies is to tell a
HD drive to *only* format it HD. And likewise, if the extra hole
isn't there, then they shouldn't format it except as a DD disk.
But there are jumpers to tell the drive to ignore the media type
sensor. And IBM, Compaq and several other companies routinely
disable this function. With the expected result that while their
systems can read the weird disks that result, nobody else can!

>uninitialized variable should go away after the change.

That did it. I downloaded the 2.5.6 files off of a.a. and it seemed
tofix the problem. However, I also downloaded the test files and had a couple
problems:

Doing a make, I couldn't compile tsignl.c - it complained about
tsignl.c: In function `handler':
tsignl.c:27: `signal_names' undeclared (first use this function)
tsignl.c:27: (Each undeclared identifier is reported only once
tsignl.c:27: for each function it appears in.)

After taking tsignl.c out of the make list, it compiled everything
fine. When I ran the TTPs, everything passed except I didn't wait for it to
finish the regexp test, and the scanf test seemd to just sit there. Also when
I ran the string test I got:

```
--------------8<-----------------------
%tstring
memcmp flunked test 6
Some Errors
%
----------------8<-----------------------
```

I am running MTOS (MiNT 1.04) on a TT with TOS3.06, compiling with
Gcc 2.5.6, and libs PL39 (hmm, now that I think about it, I don't know what
my TOSlibs are up to ... maybe in the 80s...?).

>|> BTW, do you need to put something in setenv to just be able to type

>"makefile", then (if not found) at "Makefile". The GNU version always
>looks first at "GNUmakefile", and then trys the other names. All file
>names are tried in the current directory.

Strangely enough, I tried it again, but it worked. I think you scared
it into submission. :)

>--
>--
>Andreas Schwab "And now for something
>schwab@ls5.informatik.uni-dortmund.de completely different"

BTW, despite my problems with the test suite, I tried a crack at the
Mint sources and found out its needs byacc to finish. Is there a binary
version of byacc anywhere on the archive? I couldn't find one (I found the
sources in byacc.zoo and tried to compile _those_ but I got this error:
make: execve: /bin/sh: file not found

This is weird becaus I do have a sh.ttp in my /bin directory.

Ugg.

Any help will be _greatly_ appreciated. Thanks one and all!

|> documentation came with the little FLGSET utility I'm using.

This is the minimum amount of TPA memory (in kbytes) that the program needs. If there is less than this free (as a single block) in TT memory, the program is loaded into ST memory instead, unless the biggest block in ST memory is smaller than the one in TT memory. This is presumably for programs that need a big stack, or that manages its own heap only from the initial TPA.

Are we talking about booting from external here or the IDE? If the latter then
this sounds wrong. I have 3 accs and about 15 auto folder progs and my Falcon
boots from power on to the desktop (968x680x16) in about 10 seconds.

Yes. It's called GEMulator and consists of a PC card and some software. It doesn't support MIDI which is a pain but otherwise is OK. Needs a very fast PC though - at least 386 and pref. 486. No good for most games but runs GEM software fine.

All HD drivers (at least Protar, AHDI, ICD, WtP and me assume CBHD too) does use the bootsector of the AHDI, otherwise, they would have to boot from disc (auto folder or boot sector are usual), AHDI can install itself over old drivers just fine...

197. Disk error handling

Newsgroup: comp.sys.atari.st
Date: 1994-01-04 11:18:49 UTC
From: ga@mrih.no
Message-ID: <2gbjap$lok@ugle.unit.no>
Source record: 195845

I have seen some programs that take over the disk error handling itself, so that you loose the "Drive A: is not responding" GEM alert box. Since this actually causes a crash in Scriba (Scriba looses the ROM keyboard routine, remember?), I'm very keen on finding the vector(s) to take over this error handling myself. Any help would be appreciated...

PS: When testing my printer (in mono) with TimeWorks Publisher 2, I was
disappointed about how slow the output was. Then I had a vague
recollection of a PD patch program, which I eventually found on my
PageAssistant disk (FPRINT.PRG or somesuch). This made a massive
difference, reducing print time for a complex page from about 4 minutes
to less than one (including the time that Publisher takes to generate
the page)!

Hi,

I once saw a sort of dogfight-game, in wich you can fly a paper-plane (among several sophisticated other fighters). I believe it was called 'Skychase', or something like that. Does anybody know if this game is still available (PD? ftp?).

Thanx in advance,

Jornand

I was so impressed by fprint that despite no mention of a fee in the docs, I sent
the author some $s. Didn't get a reply/thankyou of any sort. The money order was
cashed so he did get it. I register quite a bit of shareware/PD and this is the
only time my payment received no reply.

Source record: 195850

Does anyone know exactly what it means if your ST crashes with 6, 7, or 8
bombs ? I couldn't count them quickly enough before the screen reset.

Has anyone had any problems with running Sensible Soccer with TOS 2.06 ?
My ST-FM seems to crash regularly (about once per hour) with lots of
worrying bombs when I'm playing Sensible Soccer.

Yours hoping that the repair bill will not be too much,

Steve.

>

I do choose to take offence at this. True, I do work for Gribnif, so maybe my views are a bit biased, but your statement is far to strong for someone who appears not to have actually seen either package. Geneva is not "*CRAP*" in any way or comparison.

I have seen both at this point, and I didn't think Mag!X was "*MUCH*" better. I didn't get to use it for very long, so I didn't get to really try out the preemptive multitasking, which is a plus to some people, but I personally have very little call to use it. However, I thought that the user interface in general was not as intuitive or polished as Geneva's. The desktop included with it didn't seem to have anywhere near the functionality of NeoDesk, something I find it difficult to live without. Also, the program is not yet available (as far as I know) in English, or for the Falcon.

A question to who those who know more about Mag!X (and reading German :) than I do: Is it possible to load and terminate DA's on the fly in Mag!X like in Geneva?

SkyChase was a commercial game with a split screen to allow 2 players to fly
against each other. If this is what you are thinkingof then it's no longer
available. You may find it in a compelation pack of some sort but I doubt it.

Just to muddy the waters that wee bit more; using HD discs in your ST and treating them as DD is _not_ recommended; the different coating on a HD requires a higher flux to write it than your drive was designed for. I've done it in the past and never lost any data, but I don't do it any more.

Something a couple folks keep overlooking. The MegaSTe has three
serial ports (two if you put some VME board in). You can go over 19200
in modem 2 and serial 2 ports... (programs like CoNnect, etc take advantage
of these ports as well)...

Almost. There are 3 serial ports in a standard MSTe, in addition to the LAN port. I believe the LAN port *shares* the connection with one of the ports, but I'm not sure which (basically, if you're not using the LAN port, then you can pretty much ignore it). The 3rd serial port is in the VME bus (so if you get a Crazy Dots VME or something like that, then you're down to 2 serial ports, one still being highspeed...

Sure your argumenents concerning the English or the Falcon version are completely right. Development is in progress we will see new versions (in English or for the Falcon?) soon. For me personally Magix is the better alternative as it is an incredible fast operating system, not only the AES gains from this speed but also e.g. the GEMDOS filesystem. Once I got used to this new speed of my TT i never wanted to miss it again.

The Magix Desktop really will not be the best solution for the standard user (those who lack of memory btw. will be glad to have MAGXDESK and the OS in less than 200K) but you are free to choose an optional desktop - this might be Neodesk. Nevertheless Gemini 1.99 (Shareware) and Ease, which are both excellent, work fine with Magix and both support some of the extra features of this operating system.

I had this game, but I sold it to someone on the net over a year ago, as
it wouldn't run on my TT. You should be able to find a copy from someone
on the net for a decent price. It really is a fun game! Probably the
best 2 player game I've ever played.

I got a letter yesterday from Dr. T software announcing the sale of their new MIDI composing software, "Omega II" for $49. (It's nice to see that there are still developers putting out stuff for Atari machines.) I have a copy of "Tiger Cub" from Dr. T. Does anyone know what the difference is between "Tiger Cub" and "Omega II"? Also, in the letter, they quoted AtariUser Magazine, December 1993. WAS there a December 1993 issue of AtariUser magazine ever distributed. I don't believe I've seen it?

OK, I'll take a crack at these Gemulator questions:

> I. Is the amount of memory accessable to the GEMulator ST user
>configurable as it is on the Spectre or is it allocated as needed.

You can specify how "big" an ST you wish to emulate (i.e., how much ST RAM).

> II. What would the memory overhead to the rest of the system for
>GEMulator running with a 1Meg ST session?

I don't know exactly but it's negligible. The latest gemul8tr.exe software is really tiny and uses minimal memory.

> III. Can autobooting software run on it? Something like Street Fighter IIi 2
>or World Karate Championship?

Auto-running software that installs in your AUTO folder on the hard disk run just fine for the most part but not autobooting floppies. You have to START Gemulator on the hard drive first. Until you do that, your machine still thinks it's a PC.

> IV. Could a relatively well behaved game run on it? Will Populous 2 or
>Sim City run on it?

I don't know about these specific games but let's get something straight... you should NOT be considering a Gemulator if you want it primarily for game use. Gemulator does not fare well in playing games (sound, speed, compatability suffer). If you are a big time game player, then keep an old ST for that use, IMHO.

> V. Can the GEMulator access the joystick ports? If so how does the an
>analog stick get used by the GEMulator ST?

Sorry... I don't know if Darek has included pc joystick port support yet. Again, don't buy a Gemulator for games as you will likely be dissapointed.

> VI. Is linea supported.

Yes, but the degree of which depends on which TOS chips are installed on the Gemulator board. I believe the boards are still shipping with TOS 2.06.

> VII. Are all system addressed supported including IO registers.
>(context--hardware carrier detect routine)

Far as I know. Contact Darek for specifics at darekm@microsoft.com

> VIII. Are internal modems accessable? Would an RS-422 be accessable? Would
>Would devices attached to an external SCSI port onthe clone be accessable?

Ask Darek.

> IX. Can it run under DOS? OS2? Windows? WindowsNT?...
> or even GEM (clone version) '-)

DOS, yes. Windows, yes. Don't know about OS2 or NT. Ask Darek.

> X. Can GEMulator boot from a DOS partition.

Not sure what you mean by this but Yes.

> XI. Can floppies be selectively disabled and rearrainged in the drive chai
>chain? Do the ST seek rate settings (system vars) effect operation of the
>clone drives?

You can change the floppy drive designation from A:->B: via software.

> XII. Can gemulator boot from a TOS disk? Does it require the card to
>work? (your ad implied mobility of the package)

No. Other than some very trick software by Darek, the Gemulator *works* because
it carries real TOS chips in hardware!

> XIII. How fast will 'CPU' & 'graphics' speed be relative to a 520STe
>
> on a 486DLC-33
> a 486DX-40
>
> both with ISA-bus & fairly generic VGA.

Darek will argue this with me but I maintain you need a 486DX-33 to get the
same relative speed you expect from an 8MHz ST. A 486DX2-66 will be roughly
equivalent to a 16MHz MSTE. But be forewarned... while some operations will
be faster on the Gemulator, some operations are still likely to be visibly
slower or somewhat less smooth than on a "real" ST.

> XIV. Would a VL-bus video card speed up gemulator. If so, please give
>concrete examples & figures.

Anything that speeds up your PC video will help the Gemulator as well. You
shouldn't need specific figures to realize that.

> XV. Please give as complete as possible compatibility & incompatibility
>lists.

Darek has such a list available, I believe. Ask him.

> XVI. Are there any plans for a TT, Falcon, or 030 emulator? (MultiTOS)

Ask Darek.

> XVII. Can I access TT graphics models from the desktop. Can I switch bet
>between mono/color modes without restarting gemulator (as I would have to
>do on an ST)?

Yes. Yes. Video mode switching on a single SVGA monitor is nice on Gemulator.

> XVIII. CAn you please give me a list of programs that utilize
>the extra screen size/res & colors. Also, if possible give me a list
>of programs that wont tolerate being run in non-ST/TT resolutions.

Geeeez... ask Darek.

> XIV. Can the board physicall support more than one TOS chipset at
>a time & is the TOS in use easily switchable?

Yes. The board has 6 chip sockets. Which you can fill with as many TOS versions
as you can cram in there. Changing from one to another TOS is a simple menu item.

> XV. What kind of slot does the card use. Can Gemulator be used without
>the card/ROM & if so why not?

Shorty. No. You gotta have hardware TOS.

> XVI. Is there any sort of executable demo for the clone that you could give
>give me?

How about a video? Darek had those available and may still have.

: 2.5" IDE drive to replace the measly 84mb? A bummer is that left over
: from my now trashed-and-good-riddance MS-DOS machine is a 340mb 3.5"

Forget about getting a "cheap" 340mb drive in 2.5" form factor. That
size is toward the high-end of the laptop market. There should be
some sort of hack so you can hook up a 3.5" IDE drive to the Falcon.
The Amiga folks have been hacking the 2.5" IDE connector on the
A600's and A1200's so that you can use the larger 3.5" hard-drive.

It involves getting a special adaptor and either mounting the drive
externally, or removing the floppy drive and mounting that externally.
I'm not too sure of the space inside a Falcon, but I think you'll
have to do the same.

```
Alot of my friend's software packages have been sold but he still has the
remaining packages. The following prices include shipping and he's willing
to consider any reasonable offer.

Print Master Plus & library 1&2 + fonb & bord $18.00
Certficate Maker & library $18.00
VIP Prof. $13.00
Silent Service $13.00
Balance of Power $13.00
Zork Trilogy $13.00
Test Drive $13.00
Prof. Craps $13.00
SkyFox $13.00
A Mind Forever Voyaging $13.00
Borrowed Time $13.00
Mindshadow $13.00
Bartenders Guide $13.00
Thunder $13.00
DB Master $13.00
Black Cauldron $13.00
Math Talk $13.00
Shareware Disk $13.00

Please email me if interested.

>GCC appears to have some support for one as well (judging by some of the
>filenames), but I don't have a co-processor so haven't been able to try
>it.

GCC does support a 68881 coprocessor, and there are quite
substantial performance increases on a TT when using it, as I
know from my own experience. You have to watch out for a few
snags, though:
1. When creating fpu using code by using the -m68881 flag, you
must make sure that the libraries also have been compiled with
this flag (at least with gcc 2.4.x or later). The reason is that
fpu using code passes floats returned by functiosn in fpu
registers. Code not using the fpu cannot do that, of course, and
when a library function passes a floatin point value in cpu
registers when the calling code expects it in an fpu register,
trouble arises.
2. When you have the gcc include files installed on a TOS file
system, you may have to edit your math.h file and change the line

#include math-68881.h

to:

#include math-688.h

3. Also in the math.h file, make sure that the macro used to
decide (via #ifdef) whether math-68881.h is to be used matches
the one defined by the compiler driver when called with the
-m68881 option. I had a version that contained

#ifdef _M68881

but the compiler driver defined __M68881__ (by virtue of a
commandline argument). I was told this was fixed in newer
versions of math.h.

Ok, I get the picture. I'm probably looking at this too much from my
own point of view. I have a 1040 STe with a colour monitor, and that
is why I don't fancy GEM-terminals at all. Windows occupy space on the
small 640x200 screen and only Storm of all the GEM-terminals I have
tried can get me 80x24 characters on one page, by using a custom font.
I know I could probably use that horrible little font that is used in
icons, but I don't like to read a font that is so small. Then
GEM-terminals tend to have slower scrolling and text output than
non-GEM terminal programs, and with my 8MHz 68000 it makes a
difference, if I want to keep up with 19200 bps character output. But
as I said, if I'd be the owner of a TT with a 19" monitor, I might
(probably) have a different opinion.

>Hmm. I run two 38k4 links out of this system. The last version of fizz I
>looked at wouldn't even acknowledge the _existence_ of the other ports on
>this machine. And don't bitch about not needing 38k4 - you'd be
>surprised just how much of a difference it makes to a v.32bis modem.

I agree with you that recognizing more ports than the standard one
might be useful with a TT. But again, in my egoism <grin>, I didn't
think of that. I once modified my STe to get a 38400 bps serial port.
I admit that it did speed up transfer of text files, and on a faster
computer it would probably have made the BBS menus and other text
appear faster on the screen, but if you transfer pre-packed files then
38400 as DTE speed won't help, because the modem won't be able to
compress anyway. And even textfiles tend to be packed. But maybe it
really makes a difference with a faster computer that can display
text at 38400 bps.

>>let's hope they will appear in future versions of FzDT. No terminal
>>progarm that I have seen has been perfect.
>
>Have to agree with you there - oh, are they working on Fax support yet? 8)

I don't know. And because I don't have a fax modem, I don't even care
(just a joke ;)).

From: timg@ccwf.cc.utexas.edu
Message-ID: <2gcd1i$ib0@geraldo.cc.utexas.edu>
Source record: 195723

Hi,

In article <16F3437B9S85.UPS500@ibm.rhrz.uni-bonn.de> you write:

>I would be happy if someone could give me a hint whether a
>good OCR-program (reading 400 dpi-*.IMGs) is available by anonymous
>ftp for Atari ST.

Below is an [edited] excerpt from a message regarding public domain OCR software. If source is included, it might be straightforward (with gcc) to compile it for the ST. I really know nothing about what is available, other than the message included below.

-Tim Gallivan
timg@landau.ph.utexas.edu

---------- Message Excerpt ----------

There is some [public domain ocr software] on SIMTEL20 [probably simtel20.army.mil--my machine doesn't know this address]; grep the index for " OCR" (note the leading space, otherwise you'll get Democratic Convention files, too).

223. Ghostscript DOES have a DeskJet 550c driver; should I compile it?

Newsgroup: comp.sys.atari.st

Hello,

Regarding whether GhostScript has a Deskjet 550c driver ...

>Our Unix version of GhostScript 2.6.1 only mentions 500c, not 550c. Am
>I missing something?

Yes. The file gdevcdj.c contains source code for a DeskJet 550c driver.
Unfortunately, I did not compile this driver into the Atari executable
for 2.6.1.

I plan to upload 2.6.1 to atari.archive soon. If anyone would like
me to include the 550c driver before doing so, please send me email.

-Tim Gallivan

I am going to buy a Falcon this month some time. Could someone tell me
how compatable this machine will be with ST software?

I have Quick ST 2.1
Bunch of Games, Wordperfect, and a few others. These are my main
concerns. Should I get the VGA monitor and sell my 1223 or keep
it? I will be getting the video digitizing system for it also.
I also have an ICD ADSCSI+ board with a 130Meg Maxtor drive I will
attach to it. I will be getting the 4Meg 85MDrive Falcon.

Any info would be appreciated.
Thanks,

>: $GNULIB directory. A simple C program like "Hello, world" doesn't require you
>: to use a "-l" switch to link in a particular library, yet if you use the GEM
>: or curses library you need to specify the library.
>

The redefined symbol errors sound like the consequences of mixing C and C++
include files (some of which have the same names, after all). The C++ headers
should be in a folder of their own, pointed to by the GXXINC environment
string. Sound right?

As far as libraries, that's just a matter of how things are specified to work.
The C compiler driver is specified to link in the default library (what is
it for GCC, gnu.olb?). It always tries. The C++ compiler driver is not
specified to try the same thing for the default library, and it doesn't.
Having been warned, I'm kinda partial to a compiler driver that doesn't do
too much behind my back.
Steve

Back in the mid-80s I bought a brand-new Atari 520 ST, to replace my
well-worn Atari 800 and to play a game called Sundog.

Does anyone remember who made that game and/or whether it is available for
any other platforms (preferably the IBM PC)? I know it was also available
for the Apple II, but has been discontinued (stores will tell me that, but
not the name of the company that made it).

Any information would be greatly appreciated, I miss that game.

I had the same problem with SoundLab on my Atari STe (which is really
stupid, since the thing has several STe-specific features in it...)
I remember having SoundLab 1.0 running fine on my old 520ST, and when I
upgraded to my STe, it started acting flaky. It eventually got deleted
somehow, and when I found v1.1 on the net, I was tremendously excited.
However, it too bombs whenever I try to play a loaded sample, or do pretty
much anything else for that matter.
Has anyone else had these problems? I would love to get the thing working,
since SoundLab had so many neat features in it!

If you can still find a copy, "Captive" is an excellent choice. The
interface will be instantly familiar to Dungeon Master players, but it
takes place in a Science Fiction setting. You have been imprisoned on a
mysterious planet somewhere, with your only source of food through an IV
needle. However, you find a briefcase which allows you to remotely control
a team of four robots who are SOMEWHERE else in the galaxy. The game screen
shows the control panel of the briefcase, with a point-of-view screen, status
monitors, and "buttons" to control your robots... You go to all of these
different planets, with the eventual aim of rescuing yourself. Anyway, its
really cool! It's espescially nice playing a DM-type game where you get to
use automatic weapons and lasers instead of just swords. :-) The game has
lots of puzzles and stuff to think about, though - not just hack and slash.

If I could scream "ME TOO!" I would. Anyone who knows anything
about different versions of this fantastic game, please post! My
old copy kept locking up, which was very frustrating because you
lose your ENTIRE game in progress. The screen would go red on my
520ST and that was the end of my whole game (it deleted it on disk
when loaded in memory). Someone told me that related to having a
pirated copy but I had bought mine... in fact I returned a copy of
it once for another one with no luck.

And what games are similar to this on the PC? How about Star
Control or SC2?

Thanks!

I dunno about that... I have a 1040 STe (actually it's got 4 megs in it, so
it might be called a 4160 STe!!! :) and it ran perfectly from day one!
Can't remember if it plays .au's though... (oops I'm rambling..sorry!)
I don't know about a v1.1 though... I got mine a looooong time ago (something
like two years ago??) so I wouldn't know about that ver., but as far as the
old one was concerned, it wurked grate!! :) Hmmm, any other sample players
screw up on ya? (like say, the Stereo Replay demo?) If not, well...er...didja
remember to change it to med res?!?? (Yeah, I know, I'm grasping for straws!!)
Oh well...sorry I couldn't help you any more...

Sundog was published by FTL Software, the same folks who brought us Dungeon Master and Chaos Strikes Back-- easily the best game ever for the Atari ST-- and Oids, a superlative Defender-meets-Lunar-Lander game which let you design your own levels.

I know that Dungeon Master eventually came out for the PC, and I believe it was available for the Amiga. I have no idea what other platforms, if any, Sundog and Oids were available on.

Hmm... I think I need to crank up the old ST and give these babies another look. It's been a few years.

hello
the 16-bit CD-Quality "tracker" mjuzakk in the version 1.2 is now available
at ftp.uni-kl.de!!
i saw that it is not available in erlangen also they told me it would.
new: english documentation too, bugfixes, better editors....
if you still don't have it, take a look at it.
(as before, you are able to use 42 samples of whatever length in at least
6 tracks in cd-quality. they are transposed and mixed in realtime by the DSP)
have fun
bye

oh, i forgot, it naturally runs only on falcons (whatelse :-])

I have sucessfully run KA9Q on both an ST and PC and used FTP to transfer
files between them. Not full networking I know, but still might be of use
to some people.

The main advantage of this over basic communications software is that
everything can be done from one machine (a bit like LapLink(TM) on the PC).

Roland.

>
>Hope you get a working patch, the 2ms noise is not nice.

Actually, it's not a "2 ms noise" but a "6 ms noise"... :-)

The TOS 2.06 BIOS doubles the FDC's clock when it thinks that a
HD disk is inserted; since this results in _halving_ the real
step rate, the FDC is told to _double_ the step rate in order to
compensate for this.
Unfortunately, the clock doubling cicuitry simply isn't there on
non-MegaSTEs, so the resulting step rate is *wrong*...

SEEKUP.PRG simply changes the BIOS' initial density setting from
"HD" back to "DD" (by hacking an undocmented internal variable) - the
BIOS only changes this setting after a disk error or after a Flopfmt()
call...

250. Problem with SAM_SET.CPX on Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-01-05 00:14:27 UTC
From: scotty@verdix.com
Message-ID: <1994Jan5.001427.5804@verdix.com>
Source record: 195748

The Atari AFM/D2D/SAM/... users manual says that one should be able to use SAM_SET.CPX if one has the extensible control panel, instead of SAMCFG.ACC. I looked, and I've had SAM_SET.CPX in C:\CPX since day one (a few months ago).

The problem is that this CPX has *never* shown up in my control panel! Has anyone ever seen it? I've tried it with and without SAMCFG.ACC in place, and of course with SAM.PRG loaded. The CPX has never appeared!

If it does work, does anyone know of a compatibility problem? I've tried stripping things down but it had no affect. These are the CPXs I normally use:

ADSCSI, COLORVDI, CONFIG, FSOUND, GENERAL, MACCEL, MODEM, MULTITOS, NVRAM, PRINTER, SAM_SET, and WCOLORS.

Thanks for any clues, help, whatever.

PS. Anyone ever get the "startup sound" to play at a decent volume level? Since it plays before the control panel sets the volume, it always SHOUTS out of my Falcon's speaker. I have the startup sound disabled as a result.

Thanks again,

Scott Chilcote

|>
|> Perhaps Handshake output is CTS, and Handshake input is RTS (or is
|> that backwards?)? If so, would that make "*Transmit Data" == DTR, and
|> "*Received Data" == DSR (sp?) ?

I'd always seen the following defns:

DTR - data terminal ready
DSR - dataset ready
CTS - clear to send
RTS - request to send
SD - send data
RD - receive data

So handshake could be CTS/RTS, but DTR and DSR are status indicator
lines, not data transmission lines (or pins). I would guess that
"Transmit Data" and "Receive Data" are the actual data signals, while
"Received Data" and "Transmitted Data" may be status indicators as well,
inidcating data has been transmitted (or received).

Connect lets you install GDOS fonts without GDOS. There are plenty of
fonts around. Most are for hi-res, but it shouldn't be too hard to scale
them.

GEM terminals can be faster than what you have now with NVDI.

Does that imply that it doesn't have an ISA bus, that it has ~20ns RAM
(with a 32-bit path to memory, of course) and a hard disk interface that
doesn't hog the bus or cause the CPU to halt while accessing?

Sorry, couldn't resist.

Then again, I wish my ST had a hard disk interface that didn't cause the
CPU to halt while accessing... and floppy access, too.

There is at least one, probably several bugs that allow unlimited money.
Works on all versions, the amiga frontier thread mentioned this one a while
ago. Would spoil some of the fun, though. If you get really desperate,
check the aforementioned thread, or if it isn't there anymore, mail me.

Now, has _anyone_ found an effective way to use missiles, except
a) for forcing the enemy to dodge.
b) killing an unsuspecting target by almost ramming it
before launching the missiles

The buggers *never* hit. (Okay, so they usually have a HUGE velocity
vector when they start, which might be a little difficult to maneuver
around. They are still impractical.)

256. falcon, dsp, programing, documentation, help.

Newsgroup: comp.sys.atari.st
Date: 1994-01-05 01:04:57 UTC
From: dgently@binkley.cs.mcgill.ca
Message-ID: <2gd3nq$96p@homer.cs.mcgill.ca>
Source record: 195762

Hello, I am going to buy a falcon soon, and so, have a few questions about it.

First, I am quite confused about what to do about a monitor. I was thinking of getting a VGA, or SVGA monitor with Sblaster or BlowUp, but this would not allow me to use software needing a RGB monitor. Also, I was wondering if anybody has tried to connect a 19 inch sun mono monitor to the falcon, and whether this is feasable(it seems that the amount of memory bandwidth used for 1280*960 at 72hz in 2 bits would be the same as that used by 640*480*8). But no company makes a screen enlarger that supports this size(the clocks on Blowup and co only allow 800*600 at this rate), how hard would it be to make (or modify) an adaptor to support this rez?

OK, next. I am getting a large SCSI HD(I don't think I can afford one larger than 300-500 megs) and I was wondering what solutions there are for memory upgrades. I am probably going to get the 1 meg Falcon, and will need to upgrade it to either 4 or 14 megs(am I right in assuming that there are no 8 meg upgrades available yet?). To do this, I will need a sim board, I would like to know what type of simms these use, and what modifications need to be made to the falcon.

OK, now onto the software. I am getting the falcon, mainly in order to do DSP programing(and also general programing for my CS courses). What language setups do you recomend? I was thinking of going with GCC, as a C++ compiler, along with the PD dsp assembler. Are there the required librairies available for C++ or will I have to stick with C? Also, as far as an RCS, what would you recomend? and is the DevPac DSP, a much better assembler than what can be gotten in the PD? Oh, and what about 68882 support?

As far as music software is concerned, what is available? Has anybody tried DigiTape 2.0, Cubase Audio, or Notator Logic Audio, or dos anybody have information about these packages?

For telecomunication software, what is a cheap FAX package for the ST? (I just want to use it to receive Faxes.. and maybe send ASCII files as Fax. Also, A slip that could multitask would be nice. Any information?

Onto games... Are there any that are falcon specific? what are they, how good are they????

Almost finnished I think. I only have questions left about documentation. What books would you recomend, as resources for programing in TOS and MultiTos, as well as taking advantage of the Falcon and the DSP. I have heard of the Atari compendium, is this a good book? I don't care if these books, or any of the software recomended, are in English, French, or German.

Oh, I almost forgot, does anybody know of any books about programing the DSP, or about algorithems for effecs, synthesis, etc?

Well, I think that about does it for this post, Any help or recomendations would be greatly appreciated.

Bye, Bruno Schmidt
brunos@mafalda.math.mcgill.ca

PS: one more quesion, not really related to he falcon. Are there any discussion groups about the ST/Falcon, available in diges form(or whatever), which are in german of french, or is c.s.a.s the only resource available on the whole internet?

QuickST will not work. You should get NVDI. Warp9 is cheaper but not as
good. A VGA monitor is ideal for 'seriou's work, an RGB for games. You
could attach your Maxtor, but you'll have to bypass the ADSCSI board.
Have fun :-)

It's unpredictable. I have never managed to work out what happens. Alex at HiSoft knows a bit more. It seems that if you bombard the chip with data r instructions it crashes.

260. FOR SALE: tower case

Newsgroup: comp.sys.atari.st
Date: 1994-01-05 01:38:30 UTC
From: pope@feynman.ucdavis.edu
Message-ID: <CJ4v87.78r@ucdavis.edu>
Source record: 195758

Hello fellow Atarians!

I have a tower case for sale. It is for STs, but not Megas. I bought it in order to have room for the Gadgets SST, but it turned out that I still didn't have room. I ended up buying a used Mega, so the tower case is just sitting around, unused. I am asking $150 for it, and that includes however much it will cost to send it. Please e-mail me for info/price-haggling.

Holy shit, I just realized that I have owned an Atari computer for the last _14 years_ (ignoring the recent New Year)!! The first was an 800, bought in 1979 in Germany (I remember it was EXPENSIVE, the 810 floppy drive cost me $700). The second is a Mega2ST, bought in 1988. They both still work, and have been in use continuously since purchase! I intend to grab my 800 the next time I visit my parents (my father still uses Letter Perfect to write letters and such) so I can hook it to the big TV and play games.

Well, I would have to say that I have gotten much more than my money's worth out of them (even the astronomical cost of the 800 system). My first Atari sparked an interest in computers that blossomed into successful academic achievements and a lucrative career. The second provided me with DTP and other tools during most of my college years, and still gives me excellent modem capability and games (among other things). I now manage and purchase machines that make my ST look like an abacus, yet I am using the ST to type this right now (via modem).

I was considering the purchase of number 3 (a MegaSTE or a Falcon, not sure yet). This revelation has made up my mind to do so, if for nothing but to to continue an incredibly fruitful and cost worthy tradition.

Wow, 14 years. I think I'll go count my grey hairs :-).

> still available (PD? ftp?).

I have this game. It is commercial, and quite old (no, my copy is not for sale, sorry!). It is one of the coolest simultaneous 2 player games I have. For two players, it splits the screen. The graphics are straight vector, no scenery or nothing. However, it is lightning fast, and dogfighting is excellent.

About the only thing that comes close is two player F-16 Falcon using a null modem cable and two STs. Skychase is excellent.

It is likely that you could find it in a bargin bin somewhere, or used from someone on the net. Good luck!

267. Atari Demo on a PC

Newsgroup: comp.sys.atari.st
Date: 1994-01-05 04:42:30 UTC
From: mlake@irscscm.UUCP
Message-ID: <1994Jan5.044230.9884@irscscm.UUCP>
Source record: 195651

I was in Staples (an office supply store chain) a few days ago and was surprised to see a demo running on a PC off of CD-ROM written by Atari (Corp I believe and not Games). The demo ran for about a minute. It was a cartoon of a cat that gets ahold of the tv remote while the master is gone. The cat changes into different characters while playing around with the remote and watching the tube. When the master returns the cat blames what has happened on the dog. The dog gets booted out of the house and crashes into a mailbox with the name of that guy who does STReport on it. The name plate (or mailbox ... I forget which) falls into the snow (or gets covered up by the snow ... I forget which). It was a cute demo.

Odin was a high resolution and/or 256 color board, there was a review a long
time ago...in ST Magazin...however it was I think distributed or made...
whichever by Marvin AG, which...unfortunately are out of business...I do
not know who the original developers where for that board.

Cheers

273. Re: DESKJET 550C

Newsgroup: comp.sys.atari.st
Date: 1994-01-05 06:16:10 UTC
From: Graham.Irvine@mettav.royle.org
Message-ID: <757743302.0@mettav.royle>
Source record: 195771

It was none other than Fred Harris that wrote on the 30 Dec 93 that
,

-> I received a DESKJET 550C for Christmas. Is color useful for
a
-> 1040ST? I have the Turbojet printer driver for a DESKJET,
but
-> I don't know whether it supports color. The only program that
I
Haven't come across that one , is it for a particular software
package
or a general driver ?

-> have that uses color is Easydraw. Are there drivers
available
-> for the 550C?
Easydraw , Isn't that GDOS driven ,I which case I haven't come across
a
Deskjet printer driver let alone a colour one ! The best way to get
colour
output would be to use something like Imagecopy which run's as an ACC or else
run it as a program on the saved file and print from there.

-> Much software that supports color?

Those that have a use for it yes , Pagetream has an excellent
Colour
output on a Deskjet and I presume that Didot ,Calamus etc also have
suitable driver's.

As far as WP's go I am not so sure ,anyone else ?.I think Protext 6 has
some Colour option's but I beleive that they are somewhat limited (to 7
Colour's IIRC).

As far as Straight Graphic's printing Goes your best option is IMO to get
a seperate print Utility to cover all your need's . My preference is Imagecopy
2 which gives very good result's ,is highly compatible and will handle all
file
format's you are likely to throw at it .HPChrome and Print-ALL are shareware
variant's that do support colour dump's.
Gemview is the only other that I can think of .Version 3 does have printer
module's and there is definately one for the Deskjet although I haven't tried
it .

>shell to work 100% with Flash and some other programs, GSZRZ is the best there
>is for the Atari, its a pitty that all Terminal programs don't use it...

Roger,
Maybe I can help. I downloaded GRZSZ 1.9 a couple of weeks ago, and
added a couple of function key definitions to ease their usage from Flash 1.61
(which is my term program). Here is what I use:

F9 : >EX A:\GRZ.PRG -r|
F19: >EX A:\GSZ.PRG

This allows calling RZ with the option of recovering from an aborted d/l. All
I need do to d/l with Z-Modem is hit F9. If I wish to upload, I hit F19 and
then either type the name of the file(s) I wish to u/l, or hit Alt-F to select
the file from the file selector. This has seemed to work very well, and I will
definitely d/l the 2.28 version to evaluate since it sounds like it has
addressed many of the gripes I have with the 1.9 version.

Hope this has been of some help. I, like you, have chosen to stick
with Flash 1.6 since it seems to do the best VT100 emulation with my school's
VAX than the other programs I have tried.

> environment string. Sound right?

Well, I did put them in separate directories. I was getting a redefinition of
_NFILE, because for some reason the header files in my $GXXINC ultimately
#included <compiler.h>, which is in my $GCCINC directory:

% gcc hello.cc -o hello.tos
In file included from d:\gnu\incl++\g_config.h:16,
from d:\gnu\incl++\streambu.h:25,
from d:\gnu\incl++\iostream.h:24,
from hello.cc:1:
d:\gnu\incl++\stdio.h:155: warning: `_NFILE' redefined
d:\gnu\include\compiler.h:202: warning: this is the location of the previous.

I'm still not sure what the problem is. The program compiled fine and printed
"Hello, world" correctly. Executable sure was huge, though.

279. Compiling Mint 1.08

Newsgroup: comp.sys.atari.st
Date: 1994-01-05 08:25:01 UTC
From: mbaffoni@farad.elee.calpoly.edu
Message-ID: <1994Jan05.082501.192999@zeus.aix.calpoly.edu>
Source record: 195777

First, thanks to everyone that has been helping me setup my system
as a real, working compiler system.

Through several suggestions, I d/led bison and enabled those defs
inthe MiNT makefile, however, doing so results in the folowing (the rest
compiled with out problems previously):

```
--------------8<----------------------
%make
bison -d asm.y
bison: /tmpac840: access denied.
make: *** [asmtab.c] Error 2
%
----------------8<-------------------
```

This means that bison is trying to access a file called "tmpac840" in
the root directory, correct? If so, is there anyway I can change this? I
operate my TCSH entirely within U: so that references to "/" are made to the
root of the unified disk, which cannot contain files (but I suppose it will
take symbolic links...).
Also, typing bison -h (which is an error) gives a list of valid
options but I can't find the "-d" option - is this an error (ie: should be
"-b") , or is it supposed to be there?

Thanks in advance.

-MikeB

280. GDOS+Ste

HI,
I got the following problem trying to run GDOS on my French STE machine.
First I copied from somewhere in germany a version 3.1 of amcgdos. After
installing it and rebooting the machine keeps rebooting infinetely because
its trying to run this Gdos version. The fonts are there, where they should
be. The Assign.sys file is also ok, so where is the problem. I am running
under system 1.62.
Thank you
george

Hi!

Other than using a genlock, is there a direct way (and less expensive!) to hook up a video source to an SC1224?

Yat

MicroEMACS is a pretty standard text editor, and you may already be familiar with a version of EMACS on a mainframe somewhere. An ST version of 3.12 is available on atari.archive.

If you'd rather have a GEM based editor, I just recently started playing with one called Everest. It seems to be well thought out, and can even take command line input. Version 1.5 is available on atari.archive.

These are really the only two I have had any experience with. I got sick of loading Flash just to use the editor (It was SLOW on huge files, too.), so I started exploring to find a text editor. Good luck.

|> bombs ? I couldn't count them quickly enough before the screen reset.

4 bombs illegal instruction
5 bombs division by zero (ignored by TOS)
6 bombs chk instruction failed
7 bombs trapv instruction failed
8 bombs privilege violation (instruction only allowed in
supervisor mode)
9 bombs trace trap

More than 4 bombs normally means big trouble, like stack overflow or wild pointers into the text segment. Looks like the game is quite unclean.

You should delete stdio.h from $GXXINC, and also any other file that
has the same name as one in $GCCINC. They don't belong there.

|> I am going to buy a Falcon this month some time. Could someone tell me
|> how compatable this machine will be with ST software?
Generally, very. Out of 340Mb of software, I had 1 app - VIP Pro and a few bits of PD that wouldn't run. Everything is fine. That's Write is dodgy - you need to get a patch from the authors to fix it.

|> I have Quick ST 2.1
|> Bunch of Games, Wordperfect, and a few others. These are my main
Many games will work if you first run Backwards, an ST/STe emulator. Some won't work at all. Don't know about WP.

|> concerns. Should I get the VGA monitor and sell my 1223 or keep
I'd get an SVGA minimum or a multisync, I have the latter & BlowUp030 and normally run at 928x680x16 which is very nice to work with. VGA monitors limit you if you decide to go for a screen enhancer like Blowup or SCreenblaster.

|> it? I will be getting the video digitizing system for it also.
Which one? There are at least 3 in the UK - Videomaster from Hisoft which also has sound digitising etc. Vidi ST 12 and something from Titan Designs.

|> I also have an ICD ADSCSI+ board with a 130Meg Maxtor drive I will
|> attach to it. I will be getting the 4Meg 85MDrive Falcon.
Take out the ICD board and then directly connect the drive to the SCSI port on the Falcon. I have 2 external HDs in one case daisy chained to the SCSI in this way. I'd advise getting the ICD pro drivers as the Atari ones are a bit crap really.

Looks like this port of bison is broken.
Try setting TMPDIR to a pathname with trailing "/".

|> Also, typing bison -h (which is an error) gives a list of valid

It is supposed to be there, in every version of bison. It means "put
out the definition of the tokens into a separate file".

Not a great deal of help, but: SpeedoGDOS contains a DeskJet driver,
which will drive the 550c in mono (like a 510). Which colour GDOS
programs do you have? The GDOS programs I can think of are in mono.

For colour, there are non-GDOS programs such as PageStream and Calamus.
See elsewhere in this newsgroup for info about PageStream 550c drvers.
I do not know about Calamus, I don't use it.

Body handling: HTML body converted to readable text

There are several such programs. Two are called deskpic. One can only display DEGAS images, which it loads automatically on boot-up from a fixed file.

The other deskipc (much better) has a an accessory which enables you to select which file you wish interactively, or you can save your preferance for each resolution. This one can load GIFs and XIMG. (Possibly other formats, too). It works up to 256 colors on the falcon, but jams my 4.01 falcon when I do a resolution switch.

Or you can use Gemini 1.99, which also allows you to load in any XIMG picture as background. (Which also works in 256 mode. I haven't yet tested it in TC).

Sounds interesting, can these fonts be found at the common ftp-sites?
And if I should have to scale them, do I need some special software
for that, and if so, where can I get it from?

>GEM terminals can be faster than what you have now with NVDI.

I use TurboST 1.8, which makes BIOS text output quite fast (I think).
I have never tried NVDI on my machine, but I borrowed a Falcon with
NVDI for a few days some time ago, and I noticed it was very much
faster with than without NVDI. Do you think NVDI would make GEM text
output on my machine faster than BIOS output is now, with TurboST? I
dare doubt it, although it would be very impressive.

O>>
O>>I am wondering if I should use FPATCH2 and/or BMAPFIX2. RIght now I am
O>>using both, but is only one necessary???
O>>

O>One should do, I use FPatch2. But maybe Don Maple can give more info.

In short: it does *not* hurt to run both FPATCH2 and BMAPFIX2! FPATCH2
for the DMA and BMAPFIX2 for the bconmap. For more info read on...

I missed the beginning of this thread (don't ask... gateway trouble...)
but as a rule of thumb: when it comes to Bconmap - BMAPFIX*2* does
everything FPATCH2 does AND MORE! Although, FPATCH2 has the DMA fix
as well. BTW, putting two *unrelated* fixes in the same program (as in
FPATCHx) is not very smart...

A bit of "hysterical" information ;-). FPATCH2 is based on the *old*
BMAPFIX (without 2). This has been overtaken by BMAPFIX*2*. When/If
Atari returns to the computer universe I expect FPATCH*3* will copy
BMAPFIX*2*... ;-)))

Also, I'd like to set the record straight re AEO_0222 *disinformation*
(they seem to ignore my email so I'll just do the laundry in public):

AEO> If a program such as a screen saver is expecting to talk to the MFP
AEO> when accessing Device 6, then there could be a problem when using
AEO> BMAPFIX2.

If an SS tries to talk to Falcon's MFP directly *nothing* will happen (no
input) since the MFP is not connected to the serial! On the other hand if
OS
calls are used everything will work just fine because it will be
redirected
to the SCC. Ergo, I don't see how a screen saver can experience problems!?
(Do note that I'm intentionally not complaining about programs tickling
the hardware directly ;-))

Anyway, to the original poster: feel free to send me email and I'll help
if I can.

Don

P.S. I'll post this twice from different sites to make sure it gets done.
Appologies for eventual duplication.

Source record: 195792
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc.misc,comp.sys.ibm.pc.hardware

The subject sums it up. I have a very old and unreliable (well I did put 1M DIPs in the 256K DIP sockets) ST. I also have a 386 PC and would like to continue to run my ST software when the ST finally expires. Speed is relatively unimportant since I prefer strategy to 'arcade' type games.

Is there any form of ,preferably software, preferably PD, ST emulator for DOS platforms ?

(Yes I know all this implies another ST user has been seduced by 'the dark side'. You won't get me to swap my VHS video recorder for a Betamax one either !)

Nah, haven't tried this yet (as I don't yet have a Nova/CD board - rats,
where's that winning lottery ticket? ;-)

Hmm, too bad there isn't a way to move one of these boards into the
internal HD bay (since I don't have an *internal* HD on my MSTE) and then
access it from there. Nahh, that could get too messy...

I dunno if I'd want to leave the serial "hanging out" of my system. After
the fun with internal space I had with my old 1040ST and a Zram board,
I think I'll stick with a nice, properly stuck together system :-)

Actually, if you're in ST Medium res, you can set the font to "System Font 10"
(whichever is the smallest, or next to smallest, I forget), and turn off the
scrollbars. That way, I think you will get the full 80x25 text screen within
that window. The text isn't too bad to read either...

I run v1.1 on a 2Mb STE no problem. Perhaps it's queasy about less memory ? A flakey version (1.0 ?) was accidentally released and even made its way onto the cover of ST Format - shame really as it had no docs. An update, v1.11 was released but this just cured a bug with .WAV files I believe.

You could try contacting Damien - the author - at dmj@genie.geis.com

>nother drive available, I would greatly appreciate it.

Fooling the OS into thinking it has another drive doesn't sound
like a good idea to me generally, no matter what the language is.
For one thing, concurrently running programs like accessories or
other programs under MiNT, MultiTOS, or other multitasking
environments, could be severely messed up by such hacking. Other
than that, I suspect that information about the drive
configuration is scattered throughout a lot of undocumented OS
variables, whose locations may vary among different TOS
versions...

I suggest you to consider the following alternatives:

If you want the ramdisk for passing data between programs that
are run one after the other, why not just use some mechanism for
the programs to get knowledge of the user-defined name and path
of the file(s) in question. Then, users who have a ramdisk
installed can configure your software such that it uses the
ramdisk, thus speeding up processing. Others, who don't have a
ramdisk, or who don't want one, can still use the software, but
they'll have to be more patient. File names and paths can be
specified in a configuration file, or with environment variables,
for example.
Alternatively, it may be possible to have the first program, i.e.
the one that produces the data needed by subsequent programs,
terminate with Ptermres(), thus preserving the data. Of course,
then you need a mechanism for the subsequent program to establish
contact with the first program (e.g. with a cookie), and inquire
the location of the data in question.
If you intend the ramdisk just for temporarily swapping out some
data that are not needed presently but will be needed again
later, I strongly suggest to store them in arrays, strings (which
are very convenient, as they can serve as stores for data of many
types, which are accessed with the pointer operators {}, FLOAT{},
SINGLE{}, CARD{}, WORD{}, BYTE{} etc.), or MALLOC()'ed chunks of
memory (which can be handled the same way). These methods are
clean in every respect, they don't mess up the OS or other
applications, and moreover, they are likely to be even faster
than a ramdisk.

I don't know if any of these suggestions are any help to you.
Feel free to mail me, or post, more details about what you're
planning to do, so we can make more specific suggestions.

Yes, you would need some font editor. I believe there is a PD or Shareware
version of FontKit, but I think you will have to order it from the ST Club
in the UK. There must be other font editors around. GDOS screen fonts are
nt easy to find. They normally come with comms programs. I have about 10
hi-res ones if you want.

No, if you use Turbo ST, NVDI is about the same speed. It's a little
faster on GEM text and a little slower on BIOS text.

>
>The controller in the falcon is limited to around 1.1M a sec,
>_flat_strap_,
>depending on various annoying timing considerations. (NCR5380)

sigh, why is there always someone who never tried and still knows
better...

I have a Fujitsu M2622-512 hooked to our demo unit Falcon030 (stock 4/80
machine), and GEMDOS read access goes up to 1850 KB/s.
Quantum LPS 240 and Seagate 3600N drives also get that high, a 240 MB
Maxtor 7245S did 1450 KB/s, Syquest 3105S removable does 1400 KB/s.
Fastest on the Falcon was a HP 1 GB 3,5" drive doing 1900 KB/s through
GEMDOS.
For the TT (with FastRAM), it was a Quantum LPS 240 flying at 2200 KB/s.

(These are just the ones I remember, I tried loads more.)

1.1 meg/second is about the limit old STs have through GEMDOS. Falcon and
TT can do about twice the speed.

bye, Peter

340 MB is quite expensive for now. It's the maximum size anyway (for
now...)

Seagate and Conner 240 MB drives have come down in price quite a lot. Here
in Germany, an internal 240 MB 2,5" is cheaper than an external SCSI 3,5"
with cable and box.

bye, Peter

It's funny looking back. I got through graduate school in physics
using a Radio Shack Model I - upgraded from 4K to 16K memory I think.
That was enough to do some numerical integrations of wave equations
though, along with keeping the records for the classes I was teaching
on my assistantship. Now the 64MB sparc10 on my desk isn't enough
half the time! Let's hope this exponential explosion of desktop power
never stops..

I> limit

(Just my 2 cents ..)

I bought a normal VGA, which just happens to be quite good ... you never know until you try ...

My monitor did 800*600 maximum on the PC system it was used on before .. with BlowUp030 I'm running it at 1024*768i, 1024*768ni, 1280*960 and others ... the BlowUp030 is VERY flexible, thus it's able to do a lot more with a normal VGA than any other machine I've seen ..

(Note, my monitor does between 28-48kHz, and 45-125Hz, and should really be called a MultiScan ... but it was sold as a VGA .... for those interested, it's a DMC Super-MD3 ..)

I have seen Tempus II for as little as $10 used on this group. It is
an excellent text text editor (blindingly fast, lots of features, totally
reprogrammable keyboard). I bought it for about $40, and it was money well
spent. Just my $0.02.

That is a .AVI file that has been around for ages. It requires 4mb of
memory (if you have the version with sound). It is a great animation,
where the cat turns into Spock and the basketball player, etc. I think
I might have it on my hard disk somewhere. If so, I'll upload it to
atari.archive.

Not answering your actual question (sorry), but beware of using GFA's INPAUX$
facility. It took me *ages* to work out that this clobbers flow control,
which could cause overruns with fast modems if you don't handle the data
fast enough.

But does it work on a Falcon with an (S)VGA monitor though? None of the
other trackers I've looked at will, so they just end up getting binned.
Is it really so difficult to write an audio program that's independent of
the video system?

The beta offer was always posted as a limited time only, and the full release
version of Geneva has been available for a while now, directly through us,
or through dealers and mail order. I'm sorry I missed this post when it first
came through, but I had no net access for about two and a half weeks around
Christmas.

The newsletters went out over the past couple of weeks to all of our registered
users. It is possible that in some cases people could get them faster overseas
since they had to be sent by first class air mail. The US and Canada ones went
out bulk rate.

Apology accepted. :) I didn't really mean to jump on you in particular. It
is just frustrating to see blanket statements which are not even backed up
by any personal experience. Just one thing though, it is my name, I know, but
was it really necessary to preface all of my statements with BS>? ;)

>I'm sorry,the sentence should read "According to those who should know, Geneva
>has nothing MAG!X can't do" or something like that .. :-/

The problem is that you still have nothing but other peoples opinions to base
this on, and it is still a fairly strong blanket statement which is simply not
true. If nothing else, the Mag!X does not have the same look and feel of
Geneva, which is something many users feel is very important. I personally
like Geneva's much better. I suspect that there are at least a few if not
several other things that Geneva does, that Mag!X doesn't, and vice versa.
I do wish I could go into detail, but I haven't had that much time to play with
Mag!X. I also have had significant trouble figuring out how to do some things,
and what some features mean, since I don't read much German.

I'm still really curious as to an answer for the question at the end of my last
post: Can Mag!X load and unload unlimited DA's on the fly?

The order form on the newsletter does have a line for Geneva by itself, and
there should be a white third of a page flyer with every newsletter which
has a smaller pre-order form for NeoDesk 3->4 upgrades, which includes Geneva
bundle deals.

I never once used GDOS before I got SpeedoGDOS. As such, I am a slave
to the extremely easy/intuitive method of adding fonts to my system.

However, I would love to use my CoNnect fonts when I am running Speedo
(since CoNnect doesn't use the fonts in gemsys when Speedo is present). How
do you setup Speedo so that it uses non-Speedo fonts? I'm pretty sure that
someone had said that it was possible (in fact, what good isit to have a bit
mapp cache when all speedo fonts are scalable, unless you can use other
(bitmapped) fonts?) .

On a related note, has anyone had problems with strange behavior with
cached fonts? Occaisionally (more often with Works, but sometimes also with
CoNnect), the font cache gets mangled - or appears to: The symptom is that,
suddenly, characters come out too dark (sort of like the line making up a
character becomes double-width, so "a"s look like dark dots, and "o"s look
bolded. However, this does not affect printer output (only on-screen), and
is fixed by clearing the font cache in the outline utility.

For completeness, I am using a TT with NOVA16M, 1.71 VDI drivers, MTOS
with MiNT1.04, and original release versions of SpeedoGDOS and Works.

332. opus and FONT.WID problem....

Newsgroup: comp.sys.atari.st
Date: 1994-01-06 03:53:04 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <2gg1v0$ikl@charm.magnus.acs.ohio-state.edu>
Source record: 195678

I have finally been granted with the things I need to run the graphic portion of OPUS spreadsheet. I have run into the problem of creating the FONT.WID program.

When I run the program that creates it, I get the message 'Couldn't open printer workstation.' And I have to abort.

I have gotten past the ASSIGN.SYS program fine, and am sure that this is not the problem. everything is labeled as two sources of documentation specify.

I am runnning GDOS 1.1 from harddrive bootup, and my printer file is fx80.sys. Though my printer is a STAR NP-10, one manual says that this driver will handle the printer.

Can anyone clarify what this error means and/or give a solution that I should try. Is it a hardware problem? Could somebody send me the format of the FONT.WID textfile (I know its a table of some sort...) so that I could 'work' around this problem?

That did the trick. I'm just about through the home stretch - but I
have one last (I hope!) problem before the compile is complete:

Running the make, finishes all of the separate .o compilations and
does the assembly translations (I assume that is what "asmtrans.ttp" does),
but when it goes to compile all of the .o files together it says this:

```
----------------------------------8<----------------------------------
gcc -G -Wall -O2 -fomit-frame-pointer -mshort -DMULTITOS -DDEBUG_INFO -o
mint.prg bios.o xbios.o console.o dos.o dosdir.o dosfile.o dosmem.o dossig.o
filesys.o main.o mem.o proc.o signal.o timeout.o tty.o util.o biosfs.o
pipefs.o procfs.o tosfs.o debug.o rendez.o unifs.o shmfs.o fasttext.o
welcome.o nalloc2.o memprot.o realloc.o context.o intr.o syscall.o quickzer.o
quickmov.o cpu.o -liio16
/usr/bin/gcc-ld.ttp: multiple definitions of symbol `__main'. Files:
/usr/lib\gnu16.olb(main.o)
main.o
/usr/bin/gcc-ld.ttp: multiple definitions of symbol `_exit'. Files:
/usr/lib\gnu16.olb(main.o)
main.o
/usr/bin/gcc-ld.ttp: multiple definitions of symbol `___main'. Files:
/usr/lib\gnu16.olb(__main.o)
main.o
mem.o: Undefined symbol _xbios referenced from text

make: *** [mint.prg] Error 1
%
----------------------------------8<----------------------------------
```

These are such strange errors. Apparently the file that contains
_xbios is not being included (btw, I couldn't even grep the string "xbios" in
th the mem.h file). Which library file is _xbios contained in?

Does the problem with multiple definitions mean that I have some
incompatible mix of TOS/MiNT libs? I put them in the same directory - is this
a bad idea?

Thanks for all of your help so far!!

Interesting, because I have all the newest libs + gcc, yet my TMPDIR
is set to U:\tmp. What problems is this supposed to cause?

I certainly didn't get any of those errors - that last part compiled
file, but failed on "prgflags 7 7 mint.prg". Does anyone knoe where I
can find the program "prgflags"? I found a "flgset" program in the TT
directory, would this be able to do the same thing? What exactly
would "prgflags 7 7" do to my mint.prg anyway?

I did alter my makefile a little bit - in addition to the -D's you
have above, I added -mint and -DONLY030 (for my Falcon, after all!).
Don't you need to have the -mint to load in the mint libraries? I was
not sure if this was nessicary or not.

Well, I'm no expert but it seems to me that using -mint would help -
it doesn't take that long to recompile! :-)

Also, I ran into an odd problem with bison - even though I had my
YTABC and YTABH set to asm_tab.[ch], they came out as y.tab.c and
y.tab.h - I just moved them by hand, but thought it was odd.

Thanks for any help,
--

Can't remember the address offhand, but there is a vector somewhere
(0x4a2?). Anyway it's in the source code for ofake.xfs at umich in
Mint/Filsystems/ofake.zoo, but I think you'll need more info (you seem
to need to change various other vectors too)
PS Does GFA and programs written in it work with MiNT yet?

342. Timeworks 2

Newsgroup: comp.sys.atari.st
Date: 1994-01-06 09:28:55 UTC
From: andrew@minster.york.ac.uk
Message-ID: <757848534.9209@minster.york.ac.uk>
Source record: 195624

Timeworks 2 was given away on a recent edition of Atari ST Review.
Considering I can't get it to work properly on my Falcon, what do
people recommend is the best WP for my Falcon?

It must be able to print postscript to a file, it should have indexing
and cross referencing facilities, possibly vector graphics and possibly
some kind of equation editor.

Basically, I'd like many of the features of Latex or
Troff but in a WYSIWYG form.

-Andrew

P.S. If anyone has any hints on how I can get Timeworks to work it
would be very helpful so I can try it out properly.

343. Re: Atari systems, revised listing.

Newsgroup: comp.sys.atari.st

```
>>>>> Regarding Atari systems, revised listing.;
>>>>> patrik_sanfridsson@p2.stacken.ct.se (Patrik Sanfridsson) adds:

ps> Year____Model__________RAM_____________Engine & Speed__________TOS Rev's__
ps> 1985 520ST 512KB CPU Motorola 68000 8MHz 1.0
ps> 1986 520STM 512KB CPU Motorola 68000 8MHz 1.0
ps> 1986 1040STF 1MB CPU Motorola 68000 8MHz 1.0
ps> 1987 MegaST 1,2,4MB CPU Motorola 68000 8MHz 1.02,04
ps> 1988 520STFM 512KB CPU Motorola 68000 8MHz 1.02,04
ps> 1988 1040STFM 1MB CPU Motorola 68000 8MHz 1.02,04

Well, my old 1040STFM only came with TOS 1.0 and I had it before 1988,
I believe the original purchase was '86. It came out before the
MegaST series, to which I upgraded.

That's all,

>Roger, shareware does not imply cheap, it just means you get to try before
>you buy.

In the case of COMA, it's the programming that's cheap.

I managed to receive a fax today, I used a program called BTFAX, which
is for use with the fido mailer program Binkley Term. I cheated and
got my modem to answer and then ran the program, it received the fax
just fine.
COMA receives scrambled fax pages (just dots everywhere), and can't
even get the modem to connect when sending for me.

To me, it's not worth 1 cent.

No, that is not possible, because the bombs are always painted from a
fixed location on the screen. If you get another bus error after the
first, the bombs will simply be overwritten.

>Magazine, December 1993. WAS there a December 1993 issue of AtariUser
>magazine ever distributed. I don't believe I've seen it?

For the most part, Omega II is Tiger, with the software KCS, Song Editor, the New MIDI mixer, PVG, and some accessories thrown in. Dr T also debugged the package, and added a dozen or so new features to the package.

At $49.95, they are giving the package away. If you are into MIDI and have a need for anything more than Tiger, this is a deal NOT to be passed up.

If you have any other questions email me.

Hmm, someone has specs on writing Speedo device drivers. It'd be nice if
us poor antipodean developers got something better than the 1985 devkit for
our money 8(

Speaking of GNUfax, people really ought to go look : I snarfed it the other
day and had a good read - basically, GF is a queueing and communications
tool, no more.

You feed it postscript, which it then sends via Ghostscript (which you must
have installed, compiled with the digifax driver) into a queue, and thence
via your modem. Incoming faxes are simply stored as G3 faxfiles, you have to
work out what to do with them yourself.

In all, it's quite useless for 99% of the world's ST users... sorry.

>is, Robert, can you do an Atari port, or provide the source to someone!?

No - there was supposed to be an atari version - it was announced with
ARJ 1.0, but nothing has come of it... I suspect that RJ (not the RJ we know,
afaik) would be unlikely to let the source out for porting, as the PC
archiver world is a pretty cutthroat place.

If you're forced to do floppy backups, then Diamond Back II (still current?)
is the only way to go in the opinion of a large number of users here.
Despite a revolting user interface (what is it that americans have with
concentric dialogs, awful colours and _no_ structure to their interfaces?),
it seems to work remarkably well, doing compression, understanding HD
disks, etc...

>Assuming there will be an English version.

For anyone curious - yes, _very_ slick - there are some _really_ nice ideas
in this system - as an example, there seem to be _fewer_ menu entries,
yet there are more options/functions selectable (tantalise... 8)

However, I am somewhat concerned as far as stability is concerned - I never
managed more than about 5 mins uptime (mono TT, vanilla config + nvdi 2.50).
Simple things like shifting icons around resulting in buserrors... And
no show (lockup during start) under my usual config (stoked 1.09 MiNT)

By contrast, earlier versions were _very_ stable (I ran a BBS under Gemini
for many months), so I hope we'll see the same with 2.0...

>Ofir ogal@cix.compulink.co.uk

Please, julian, pass my congrats on to the guys - a very nice product!

|> res I can get out of the Screenblaster.
VGA really isn't much good if you intend using Screenblaster or Blowup030 (I'd recommend the latter BTW - more configurable). You really need an SVGA or better yet a Multisync - the latter are much cheaper than they used to be. I paid GBP250 for mine and run at 968x680x16 on it.

|> I will also have a 1224.
You'll probably need to keep it. A lot of software only runs on VGA or RGB but not both.

|> Has anyone used the 286 Emulator with the Falcon?
It got fairly good reviews. In DOS it's not so good color wise but has a Windows driver to give you 256 colors under Windows. Norton speed is about 15 from memory. A 386/486 one is on the way. Maybe it's worth waiting???

__DIRENTSIZ is a macro in dirent.h so maybe there is a typo in the source
for libolb93.zoo.

the version of gzip I am compiling is 1.2.3

AFAIK it's some sort of 6502 derivative. Not a 68K though.

|> By that I mean can you carefully remove both chips to give a cheap
|> 16 Mhz ST ??
Even if you could, putting in a 16Mhz rated 68K doesn't mean it will go at 16Mhz.
The speed of the processor is controlled by a clock which runs normally at 8Mhz.
A 16Mhz upgrade means adding a 16Mhz rated CPU as well as a 16Mhz clock.
Additionally, with the rest of the system running at 8Mhz, this will not be much
quicker unless you add a local fast

It was mainly sold as a big HD with it pre-installed for TTs. It only supported mono X windows but was a pretty full implementation with some nice development tools. It is no longer being developed AFAIK although Atari Uk told me they would sell me a copy if I wanted one (that was about 6 months ago). It was very expensive. From memory it cost something like 2500GBP.

>GCC does support a 68881 coprocessor, and there are quite
>substantial performance increases on a TT when using it, as I
>know from my own experience. You have to watch out for a few
>snags, though:
I don't know a lot about this, so I hope someone will correct
me. There are three ways that gcc might use a coprocessor:

1) '881 through its memory mapped command register -- mntlib can do
this when compiled with -DMC68881 and -DSPF004 (or something very
similar). in this case, gcc won't know about floating point
registers.

2) '881 through a linef emulator -- some other software catches a linef
execption and moves data to the memory mapped '881. in this case gcc
-m68881 will produce inline floating point commands just as it would
for a TT and '882. I don't know wether a linef emulator like this
exists, and it would certainly require tos >=1.6.

3) you have an 020 or 030 and an '882. the cpu sends linef commands
directly to the fpu and gcc can treat them like normal assembly
commands.

So, my questions are: Do you get significant speedup with
option 1? Can the gcc math libraries sense wether and what kind of
copressessor is present, and take appropriate actions?

I believe 16mHz 68000 chips only cost about $8 new, so there is probably
no reason to sacrifice a Lynx for it (if in fact there is one in there).

If you mean source code, I'm not sure. If you mean a binary you can
use right away, ftp to atari.archive.umich.edu and grab Opus. Many
consider it to be the best spreadsheet you can get for the ST.

You're right, you won't be able to run "all" programs needing an RGB-monitor. You will, however, get rid of the unusable interlace of RGB-monitors, you will be able to run all programs except demos without destroying your eyes as you would by using the RGB... You will get higher usable resolutions... Nope, there is no alternative to an SVGA, other than a MultiSync that can go as low as 15kHz, then you'll get the best of both worlds...they are not easy to find these days unfortunately... Get an SVGA!!! Don't know about the 19" ;-(

I think there are at least one SIMM-board that can take 2Mb SIMMs, and 4 of those SIMMS will give you 8Mb.... The one from GE-Soft I think was able to do this.....

> For telecomunication software, what is a cheap FAX package for the

I have not really given that any thought yet. But I guess it would have to be a DOS v (Netbios) since I have not gotten Linux installed on the PC.

Is there any Netbios compatibel software for the ST. I must confess that I am a novice in this field. And that I really havent gotten the foggiest as to what Netbios is. However I have had some experience with TCP/IP..

Best Wishes

>I have heard it emulates a 33Mhz 286.

Lannie,

seeing that you are in the USA, prices for VGA and SVGA should not
be so bad. A Midwest Micro ELITE SVGA that can do 1024x768 costs around 229
U$D....for about 179-189 U$D or so you can get one that does 800x600 or
1024x768 Interlaced though. Maybe even less....

However both the screenblaster AND the BlowUp030 can display 1024x768 or
higher..but interlaced...to get a good VGA Monitor look in the Computer
Shopper. Your SC1224 will become redundant if you want to use any of
the Expanders as a prerequisite IS to have a VGA at least.

Cheers

Someone should just make a software company that takes old arcade and computer
games and rewrites them for the new hardware (video/soundcards)

Why bother making these 50 disk adventure games when you could have
starcastle, lode runner, blasteroids, marblemadness, etc.

THOSE were good games. They had to be fast and challenging because of their
simple graphics and processors. Put them on new machines and revamp them
into NEW versions (Marble Maddness '94), etc!

I wish these companies would wake up. So many companies died. Look at
Bilestoad for the Apple, great game, and you thought Mortal Kombat was violent!

Ahh, but isn't DBII a commercial product!? The beauty of ARJ is that it is shareware, although the compression is a bit naff compared to .lzh and .zip algorithms, the extra options more than make up for it....

Allthough the result is the same; the hard disk/floppy interface is ok.
It's the software (os) that causes the machine to halt while accessing
floppy/hd.

Does anyone know if Mag!x have interrupt-driven DMA (which won't block the
machine) ?

From: ee90jde@brunel.ac.uk
Message-ID: <CJ8AEM.1E8@brunel.ac.uk>
Source record: 195638

I've just put together a slightly customised falcon system. I bought a 4 Meg Falcon from Silica for 699 pounds, then a tower system from System solutions for 179.95, the Eagle 32 accelerator (Expandable with 32 Meg of fast ram, and no I couldn't afford the ram yet), 213 Meg Maxtor 3 1/2 inch IDE hard drive for 194 pounds, and an adaptor cable for power and connection to the IDE for about 15 pounds. The Eagle 32 cost about 279.95 pounds. The system is now running Okay but what I want to know is if anybody out there can give me a list of the software I would have got if I'd bought a Falcon with a hard disk already installed?

392. 520ST Software suitable for Yng Child??

393. FPATCH & BCONMAP

Newsgroup: comp.sys.atari.st
Date: 1994-01-06 23:46:34 UTC
From: donm@ucon.gun.de
Message-ID: <1994Jan6.234634.13741@ucon.gun.de>
Source record: 195564

O>>
O>>I am wondering if I should use FPATCH2 and/or BMAPFIX2. RIght now I am
O>>using both, but is only one necessary???
O>>

O>One should do, I use FPatch2. But maybe Don Maple can give more info.

In short: it does *not* hurt to run both FPATCH2 and BMAPFIX2! FPATCH2
for the DMA and BMAPFIX2 for the bconmap. For more info read on...

I missed the beginning of this thread (don't ask... gateway trouble...)
but as a rule of thumb: when it comes to Bconmap - BMAPFIX*2* does
everything FPATCH2 does AND MORE! Although, FPATCH2 has the DMA fix
as well. BTW, putting two *unrelated* fixes in the same program (as in
FPATCHx) is not very smart...

A bit of "hysterical" information ;-). FPATCH2 is based on the *old*
BMAPFIX (without 2). This has been overtaken by BMAPFIX*2*. When/If
Atari returns to the computer universe I expect FPATCH*3* will copy
BMAPFIX*2*... ;-)))

Also, I'd like to set the record straight re AEO_0222 *disinformation*
(they seem to ignore my email so I'll just do the laundry in public):

AEO> If a program such as a screen saver is expecting to talk to the MFP
AEO> when accessing Device 6, then there could be a problem when using
AEO> BMAPFIX2.

If an SS tries to talk to Falcon's MFP directly *nothing* will happen (no
input) since the MFP is not connected to the serial! On the other hand if OS
calls are used everything will work just fine because it will be redirected
to the SCC. Ergo, I don't see how a screen saver can experience problems!?
(Do note that I'm intentionally not complaining about programs tickling
the hardware directly ;-))

Anyway, to the original poster: feel free to send me email and I'll help
if I can.

Don

P.S. I'll post this twice from different sites to make sure it gets done.
Appologies for eventual duplication.

396. Re: SCSI 2 hard disks ...

Newsgroup: comp.sys.atari.st
Date: 1994-01-07 00:41:09 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CJ8HwL.Mvy@cix.compulink.co.uk>
Source record: 195642

>It was none other than "Roland Givan" that wrote on the 30 Dec 93 that ,
> "G> AFAIK there are at least 4 different types of SCSI2

Dare I comment on this as other people have already pointed out the simplicity (and inherent confusion) in my original post? *grin*

Clarification: The SCSI 2 types (1-4) I was talking about were an 'on the fly' definition by myself in order to try and catorogise what is available in the market. They don't bare any relationship to the SCSI 2 spec.

>But do types 1 and 2 share the same basic instruction set ? Just that the
>Falcon cannot access the extended Fast element ?

AFAIK the core of SCSI 2 is a tiedied up and rationalised version of SCSI 1. Therefore a SCSI 1 drive will talk to a SCSI 2 controller, and a SCSI 2 drive will talk to a SCSI 1 controller. Whether this is always true, I don't know.

However - many Falcon owners have successfully connected their SCSI 1 drives to the SCSI 2 controller in the Falcon. Also one of my SCSI drives is a SCSI 2 Seagate ST1280 (which is basically an OEM ST1480) and this lives quite happilly with my SCSI 1 Quantum and my (unspecified but probably SCSI 1) NEC CDR-37 CD-ROM.

>My interest is primarily though that I am looking for a SCSI2 for my ST
>and assuming I have a ICD Host am I also going to run into problem's on

In my limited experience - SCSI 2 drives will work with SCSI 1 controllers (eg ICD AdSCSI Plus).

>score ? I have been looking at drives that are being called 'Fast SCSI2' sinc
>I assumed this was just an advertising adjective :-)

I always beleived that 'fast SCSI' meant a SCSI drive whose bus could operate at up to twice the speed of a SCSI 1 bus, but apparently that is an oversimplictic statement.

Likewise 'wide SCSI' should have a 16bit bus instead of the 8 bit on the SCSI 1, but how backwards compatible this is, I don't know.

Hope that helps

:-)

Roland.

The part you are quoting is referring to Bison (1.19) from A.A. as
having a problem, not GCC or libs.

[errors delted]

>I certainly didn't get any of those errors - that last part compiled
>file, but failed on "prgflags 7 7 mint.prg". Does anyone knoe where I
>can find the program "prgflags"? I found a "flgset" program in the TT
>directory, would this be able to do the same thing? What exactly
>would "prgflags 7 7" do to my mint.prg anyway?

I don't know where to get it, but the prgflags.ttp would set the flags
governing how the program is loaded into memory and where it allocates its
memory. Since you don't have any fastRAM, it isn't necessary for your
compilations (it isn't strictly necessary for _any_ compilations, but it is
useful ...).

>I did alter my makefile a little bit - in addition to the -D's you
>have above, I added -mint and -DONLY030 (for my Falcon, after all!).
>Don't you need to have the -mint to load in the mint libraries? I was
>not sure if this was nessicary or not.

I don't think so since I have the -DMULTITOS, but I could be wrong.
The -DONLY030 sounds like a good idea - I'll add that while I'm figureing out
this bug ....
>Well, I'm no expert but it seems to me that using -mint would help -
>it doesn't take that long to recompile! :-)

Well, if I had a Medusa and everything was in a RAM disk, you might be right. However, since I don't have a Medusa, it does take a while (but the ramdisk is something I'm taking a look into...when I know it works fine without it...).

>Also, I ran into an odd problem with bison - even though I had my
>YTABC and YTABH set to asm_tab.[ch], they came out as y.tab.c and
>y.tab.h - I just moved them by hand, but thought it was odd.

Considering I don't know what they are for, I think its even more odd. :)

The Jag is the only thing so far (apart from the PC) that DOOM is being developed for. Kick-Ass game, I hope that someone out there will do a Falcon Port .... Hey, it's almost worth shelling out $$$ for a PC to play doom ...

Karl.

>"Tiger Cub" from Dr. T. Does anyone know what the difference is between
>"Tiger Cub" and "Omega II"?

This is indeed interesting. In the fall/winter 1993 catalog
from Soundware (a music software vendor) Dr. T's has an ad for
Omega II that states SRP as $299!
I guess I'll have to call them to see what is up? By the way,
their phone number is 800-989-MIDI.
Does anybody else know what is going on here?

None other. They predict the Jaguar version will surpass the PC version.
Much to the consternation of 3DO advocates, Id has also said they don't think
much of the $700 machine, and prefer Atari's $250 one...

Hello,
I was wondering if there's still anyone out there who would like to share tips and stuff for Time Bandits. I just really started playing this game and have found several parts of it a little difficult to comprehend (ie the text stuff). Also, I'm stuck in Dungeon Master (the best RPG ever written IMO). Any help with these would be greatly appreciated!

Sorry Karl, Doom was developed on NeXT computers and ported to DOS. So NeXT
for Intel Processor was first, and a Black NeXT version is due out soon.
That makes 4 versions, NeXT FIP, DOS, NeXT Black, and Jag.

You wouldn't think much of the 3DO either if Atari had flown down and made you
an "offer you cannot refuse" ;-)

Atari bought ID off to make the DOOM version for Atari. Don't know the actual
deal, but by reading in the press, and comments from Atari, it seems that Atari
"just had to have Doom for the Jaguar" and "made it happen". $ talks.

This is the Straight Fax Speedo GDOS driver - it outputs each page
into a fax file, which you then can send with a fax program (like
Straight Fax). Straight Fax has a number of such drivers for various
programs - they work pretty well.

You are correct in assuming that I am speaking of the atari.archive.umich.edu ftp site. Check out the Editors directory. MicroEmacs can be found in two different versions on there. One is in the director ME3.12 or something like that. The other is in a file something like MicroEMACS3.12.zoo.

Everest is in a file named something like evst150b.lzh.

Good luck.

Hello Gang,

I just wanted to state that since I've been using GENEVA I've grown to love my Atari more. With all of the functionality of GENEVA, I don't know how anyone could ever consider it "crap." It makes me wonder if the person who called it so... if they every actually used it... and if so... if they had any documentation... as there have been many times I've heard people call a piece of software (and NOT just on the Atari platform) crap simply because they weren't smart enough to buy the package with the benefits of documentation.

I have been using a Supra 2400 until recently. One of my friends at school bought a LineLink 14.4k modem and let me borrow his Supra 2400 Plus. I like this Supra 2400 Plus, but I seem to have some problems with flow control.

I know that the ST has some bugs with RTS/CTS, so I got Serial Fix 2 and the CPX module to use with Flash 1.6. Using these, I have no problems d/l'ing with Z-modem at 2400/REL-LAP-COMP (port set to 9600). I *DO* however have problems with large amounts of text. If I do an extremely long directory listing or VT100 movies or such, portions of the text will get lost at these high speeds. I have also tried Storm 1.02 and the demo of Flash II with the same results. With Storm, I get less data loss with the flow control set to Both than simply RTS/CTS. Do I need the modem CPX as well? I understood that term programs would overwrite your default settings using the modem CPX anyway.

Any help on this would be appreciated as I plan to get a LineLink soon myself, and if the system can't keep up at 9600, I know it's gonna have problems with 19200.

Also, has anyone had any experience with the program on the umich ftp site named HISPEED.LZH? It claims to patch Flash to use RTS/CTS properly.

From: hwl0978@gemini.tntech.edu
Message-ID: <XFTKB3AW@math.fu-berlin.de>
Source record: 195574

I am getting ready to get a hard drive, and I have some questions about TOS versions. I still have 1.0, and I know it has some bugs (archive bit, date, etc.).

First of all, I need to know what programs should be used with a hard drive and TOS 1.0 to speed it up and fix some of the bugs. I know about FATspeed, Pinhead, and Copyfix. I also know there is some archive bit patch program (not sure what it is, so I need to know it as well).

Secondly, I need to know about upgrading to a later version of TOS. When I checked on TOS 1.4 a few years ago, I was informed that it cost $100, and it had to be installed by a dealer (Atari's rules). I found someone who was willing to ship me a copy anyway, but I didn't have $100. So, I never upgraded. I am still looking to upgrade, but I understand that 2.06 is available for the original ST's with an add-on board. I need to know sources and prices for this board, TOS 1.4, and TOS 2.06. I also need to know about the availability of switches allowing multiple TOS versions. I have the 6-chip set in both of my ST's (520 ST and 1040 STf).

I know that some programs would not run on 1.4 since they used shortcuts. Were there any that run under 1.4 but would not run under 2.06? Also, what were the major changes in 2.06 from 1.4?

Thanks for any help you can give on these matters.
Hiram

420. DC Data Diet and hard drives

Newsgroup: comp.sys.atari.st
Date: 1994-01-07 09:01:59 UTC
From: hwl0978@gemini.tntech.edu
Message-ID: <4FTKBYGW@math.fu-berlin.de>
Source record: 195575

I am getting ready to purchase a hard drive, and wanted to know more about DC Data Diet. I understand it is a program like Stacker on the PC.

My question is how it works within the max partitions size under TOS. I know that TOS 1.0 is limited to 16M partitions and TOS 1.4 is limited to 32M. Since Data Diet effectively doubles the size of the drive, will the partitioning need to be done differently or will it just double the effective size of the max partition?

Also, how fast/compatible/etc. is it? In effect, is it worthwile to consider? I am looking at anywhere from a 131 meg to a 270 meg drive, and wanted to try and get it set up right from the very beginning.

Nothing really, it's just it's color support under DOS is very limited compared
to it's support for Windows. It utilises a Windows screen driver to improve
things under windowss.

You can buy two monitor plugs: One for SVGA (better get a Multiscan) with
Blow-up, and one for the RGB monitor (if you have an old Atari RGB monitor).

>(the clocks on Blowup
>and co only allow 800*600 at this rate), how hard would it be to make (or
>modify) an adaptor to support this rez?
In my experience, if the Blow-up doesn't support it, it can't be done.
I think you are bumping against BUS speed, not Blow-Up.
>Also, as far as an RCS, what would you recomend?
Interface. To my knowledge so far the only one that can do color icons.

> As far as music software is concerned, what is available? Has anybody
>tried DigiTape 2.0, Cubase Audio, or Notator Logic Audio, or dos anybody have
>information about these packages?
I haven't tried any of the above (can't afford them, yet), but try winrc from
a.a.u.e for some D2D recording with on-line effects. You should see people
on my last party laughing when they started playing with winrc's real time
pitch shifter :-)

In article <A11124@MS.maus.de>, Julian_Reschke@ms.maus.de (Julian Reschke) says:
>
>Mag!x is ~ 150 K, *including* everything (BIOS, XBIOS, GEMDOS, VDI, AES)
>except desktop.

Does it need to have a desktop specifically designed to handle the multitasking
(like Geneva) or is it more just "running the the background" like MultiGEM?
(I have both, BTW)...

My one complaint about Geneva so far is that various software makes my
screen "shift" over about a half inch or so on a 13" monitor. In particular,
Pinhead and MiNT. I'm kinda curious as to why this is. Oh, BTW,
how does one "tear menus" under Geneva? (I know, I need to read the
manual, but it should be intuitive, right? :-)

Rob

...I find it fascinating that MGEM reminds me a bit of MultiFinder on the Mac,
and Geneva more like Windows (Taskman, etc)...

428. How to identify the current baud rate (old TOS)

Newsgroup: comp.sys.atari.st
Date: 1994-01-07 13:41:19 UTC
From: bhanses@vnet.ibm.com
Message-ID: <19940107.144119.702@vnet.ibm.com>
Source record: 195588

I have a typewriter (IBM 6715) connected via the serial port to my ST. Setting the correct baud rate from the program requires power off at the typewriter, otherwise it may react very strange. To prevent power on / power of for each new call of this program I want to check the baud rate first and if ok, the init of the serial interface could be skipped.
Therefore I need to know the baud rate currently set in my ST. I know that for newer TOS versions it can be returned via the rsconf(), but my old TOS version does not support this. Could someone please tell me how to search for the baud rate? Is it hidden at a certain storage location or in one of the control registers?

Thanks for your help, Bernd Hanses

> Any recommendations for War games for ST? Want something that requires
> a lot of thought - visual action would be cool, but strategy would be
> most important factor (updated Eastern Front?)
>

There is a twin-pack of games (I'll have to check the publisher, I don't have them, my friend does) called MAY 1940 and BLITZKREIG. The two games cover very similar periods and areas, but in the former the player is the Germans and in the latter the Allies. These are the only games I've seen which have a similar feel to Eastern Front.

PLUG: I will soon be releasing my Shareware wargaming system (two-player only). It is a bit like SSI's old Wargame Construction Set but with the addition of morale, facing, diagonal movement, objectives, user-definable terrain types and various other innovations.
The program itself is finished, the only reason it hasn't been released yet is that I'm still working on the documentation and example files. Anyone who is interested in a copy is welcome to EMAIL for more details.

Are you sure this is an AVI player, not an AVS player? AFAIK AVI files are from video for windows. If such a player exists for Atari ST or Falcon it would be great, especially if source was available since that would finally allow some useful Multimedia applications to be developed for the Falcon.

Erlend.

Get a Naksha mouse if you can. Someone asked this question on CIX recently and
got 15 odd replies saying Naksha and not one for any others!
System Solutions, Silica, just about anyone should be able to do one for you.

Cross-posted to: comp.sources.atari.st,comp.binaries.atari.st,comp.sys.atari.st,news.groups

After I posted a while ago asking if the groups should be dissolved, several people stepped forward volunteering to moderate. I'm happy to report that one of them is just about ready to start, so as of now I'm stepping down as moderator.

Please welcome Annius Groenink, avg@cwi.nl, to both groups. Under enthusiastic new management, I hope the groups will take on new life. I'll continue to hang around both groups in an advisory capacity for a while, but this is probably the last posting you'll see from me here.

All new submissions should be sent to the abovementioned E-mail address, and you should adjust your moderators or mailpaths file accordingly until the change is reflected in the List of Moderators maintained at Uunet. The archives will remain at ftp.hyperion.com until I can find another home for them (any volunteers?)

I'd like to thank everyone who participated over the years, both readers and submitters. It's been an interesting ride.

See you all on the net!

-Steve

Message-ID: <1994Jan7.180750.43429@urz.unibas.ch>
Source record: 195452

Mag!X is ca. 150 kB long, has it's own desktop (but just a simple one).
you can use an alternative desktop e.g. neodesk, gemini (in germany
Mag!X 2.0 is sold together with EASE (which can use Kobold for copying,
deleting, etc).
you can terminate any process at any time or switch between them
(except if you are in single mode (necessary for old progs)).
and it is pretty fast even on my 1040st (68000 proc.)

so for a multitasking enviroment it is a pretty good choice!

Unless the MSTe is unique is should be using SCSI drives, not IDE.
On my TT I have a 25 pin SCSI connector. Doesn't the MSTe have this also?

445. Calligrapher & DA Vektor

Newsgroup: comp.sys.atari.st
Date: 1994-01-07 18:56:14 UTC
From: abi@sn2.ee.umist.ac.uk
Message-ID: <1994Jan7.185614.27598@nessie.mcc.ac.uk>
Source record: 195597

Hi ALL,

I got Calligraphar (gold) last year, and I've just got DA Vektor, and I've now got a few problems with exporting/importing .GEM metafiles between the two !

DA Vektor seems to be working Ok and merrily exports and imports .GEM files. I haven't got any program that can really test the files - I've just downloaded GEMVIEW 3.0 from ftp.uni-kl.de to do just that (don't know when I'll get round to trying it though).

I created a nice 3D-extruded pound symbol which I wanted to import into a Calligrapher document, when I did the smooth curves got turned into sharp lines (YUCK !!!!!!)

What I want to know is :

* Can Calligrapher cope with bezier curves ??? (should it be able to ???)

* Does anyone *definitely* know if Calligrapher is being supported & updated (it has a lot of nice features - they just need debugging a little).

* Can anyone recommend an alternative to Calligrapher (Pagestream, Papyrus - the new HiSoft document processor, etc) ????

* Are there any ftp sites with stuff for DA Vektor (fonts, drivers, etc) ??? (I've already downloaded Calamus fonts from src.doc.ic.ac.uk)

Any help/comments/information concerning the above questions (or anything thats related to them) will be gratefully recieved.

I can't always get access to comp.sys.atari.st so awnsers via e-mail would be appreciated - any msgs I get I'll stick together and post here as soon as I can.

Thanks in advance for any help,
Bye for now,

Andrew

446. GEM SZRZ 2.28 Available

Newsgroup: comp.sys.atari.st
Date: 1994-01-07 19:17:26 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2gkcg7$tf@mailer.fsu.edu>
Source record: 195596

Gem SZRZ 2.28 (successor to the popular version 1.9) has been uploaded to atari.archive.umich.edu, with the permission of the author. I have put a readme file in the distribution that explains the contradiction concerning the distribution statement in the author's documentation.

The author is currently selling version 4.0 of this program. If the increase in quality from 1.9 to 2.28 is any indication, 4.0 should be incredible. Purchase information is contained in the distribution file (gszrz228.lzh).

T-Shirts are available in turquoise or ash gray in a variety of sizes
for $10 (plus $3 shipping). If it accompanies an order, there will
only be one shipping charge.

I was wondering whether you could get file mail through GENie. I
guess not. Here are the two text files, back-to-back. The first is
called W9UPDATE.TXT and the second is EASY_UP.TXT:

For immediate release

CodeHeadQuarters
Friday, September 17, 1993

....
: :
: CodeHead Technologies announces Warp 9 3.80 :
: :
: Including Extend-O-Pak :
: :
:...:

The long-awaited upgrade to Warp 9 is here!

Feature List
---

o Fully compatible with the Falcon 030 computer.

o Fully compatible with SpeedoGDOS.

o Seven completely new Extend-O-Save modules!

o Seven of the previously-released modules have been enhanced, adding Falcon compatibility and new features, such as Alternate Screen, Test mode, Falcon "true color" support, and more.

o A newly-designed Warp 9 Control Panel provides easier access to all options and allows you to configure which page of features will appear upon the opening of the accessory.

o A new program, Extend-O-View, runs as an application for Extend-O-Save modules so that you can simply double-click on modules to load and view them! Or install Extend-O-Save modules right in your HotWire menu to select them with a single keypress or mouse click.

o A new accessory, EOS Timer, handles a new generation of Extend-O-Save modules which operate through the GEM event system. This allows modules to do disk access, and make many other types of system calls previously unavailable to Extend-O-Save modules. The Slide Show module mentioned below makes use of these new features.

o New MakeFast program provides users of TOS 1.0 and 1.2 a faster bootup of Warp 9.

o Now comes on two floppy disks containing over 1.3 megabytes worth of files. Disk two contains 20 Extend-O-Save modules from CodeHead Technologies and eight modules from other authors.

o Includes a 30-page manual addendum documenting all new features and Extend-O-Save modules.

New Extend-O-Save Modules

Slide Show - Picture files are displayed in an automatic slide show. The slide show displays pictures in any of the formats supported by Warp 9, including beautiful 256-color pictures on the Falcon 030.

Flying Thrones - A take-off on the popular Flying Toasters screensaver available on other platforms. Flying Thrones includes a separate program which allows you to load your own images/animations. Due to trademark restrictions, we can't release a clone of Flying Toasters, but now you can create your own version.

Rain, Man - Expanding circles appear on the screen, like drops of rain water hitting the ground.

Things That Go Bump... - The blinking eyes of various creatures randomly appear and disappear, accompanied by optional night sounds.

Spotlight - A circular section of the screen roams around a dark
background as if a flashlight or searchlight were lighting it.

Filled Shapes - Random shapes with variable number of sides appear
randomly, filled with random fill patterns.

RAM Page - The screen fills with an ASCII representation of the internal
memory of your computer, providing page after page of interesting and
unique screen displays. You might be surprised at what you've got inside
-- and it's not Intel.

Availability

Warp 9 3.80 with Extend-O-Pak is available now. The retail price remains
at $44.95. Owners of previous versions of Warp 9 can upgrade to v3.80
for $25 plus $3 shipping ($4 Canada, $6 overseas). Send us your master
disk and $28 to receive the upgrade. For more information, contact your
local dealer, or:

For immediate release

CodeHeadQuarters
Friday, October 7, 1993

....
: :
: CodeHead Technologies announces :
: A New Update Policy for Warp 9 :
: :
:.....................................:

You asked and we listened!

Many of our customers have asked for an easier way to obtain their Warp 9
upgrades. Until now, we've required the return of your original disk in
order to receive most upgrades.

Effective immediately, CodeHead Technologies will accept upgrade orders
from registered owners of Warp 9 without the return of your original disk.

Upgrade orders may be placed in E-Mail on GEnie, Compuserve, Delphi, our
own BBS, by phone, FAX, or mail. All that is required is that we have
proof of your ownership of Warp 9 by one of the following means:

1. Inclusion in our database from your registration card.
2. Direct purchase with an invoice from CodeHead.
3. Return of original disk.
4. Receipt from a dealer showing Warp 9 purchase.

If you have any questions, give us a call. We value our customers' satisfaction and listen to your suggestions. The Warp 9 v3.80 upgrade is $25 plus $3 shipping ($4 Canada, $6 overseas). It comes on two disks, includes dozens of interesting and entertaining screensaver modules, and now has Falcon and SpeedoGDOS compatibility. For more information about the features of Warp 9 v3.80, read the online press release that was issued as W9UPDATE.TXT on September 17, 1993.

You are correct. I meant AVS player. It's been awhile :-).

You can select the Gemulator to emulate a 512K, 1040K, 2048K, or 4096K
ST at boot up

>
>
>II. What would the memory overhead to the rest of the system for
>GEMulator running with a 1Meg ST session?

Are you going to multitask? If so I have been able to run the Gemulator
emulating a 4 meg machine under OS/2 with no problem. I do have 8 megs of RAM
on my PC. It can also run under windows, but I have been unhappy with the
results, it seems to be too sluggish.

>
> III. Can autobooting software run on it? Something like Street Fighter IIi 2
>or World Karate Championship?

Gemulator will not work with most copy protected disks. It reads and writes
all the flavors of the TOS format with no problems otherwise. My guess that
most of your games will not work for this reason.

>\
> IV. Could a relatively well behaved game run on it? Will Populous 2 or
>Sim City run on it?
As long as it is not copy protected, the Gemulator emulates all the hardware
of the Atari (less joysticks [should be in next upgrade] and MIDI ports)
>
> V. Can the GEMulator access the joystick ports? If so how does the an
>analog stick get used by the GEMulator ST?

See above

>
> VI. Is linea supported.

Yes. all systems calls are supported.

>
> VII. Are all system addressed supported including IO registers.
>(context--hardware carrier detect routine)

Yup.

>
> VIII. Are internal modems accessable? Would an RS-422 be accessable? Would□□

It depends on your modem. The Gemulator allows you to use either com port
1 or 2 to act as the emulated serial port. As long as your modem uses either
of the two com ports, it should work fine.

>Would devices attached to an external SCSI port onthe clone be accessable?

Only the hard drive as far as I know.

>
> IX. Can it run under DOS? OS2? Windows? WindowsNT?...
> or even GEM (clone version) '-)

I'v successfully run it under DOS, Windows (a little too sluggish, but it
works), and OS/2. I'm not sure about GEM for the PC. (I don't know anyone
who has it anymore)

>
> X. Can GEMulator boot from a DOS partition.

Yes and know. A DOS partition can be larger than the 32 meg partition limit
on the Atari. If you partition your PC drive so that the first partition is
32 megs or less, you may access it directly. Otherwise, writing directly to
the hard drive could be destuctive to your PC data.

Up to 4 virtual hard drives are supported however, and they may reside
anywhere on your hard drive. I like the virtual drives since I can use
PKZIP to compress and backup an entire hard drive in one file. Virtual
hard drives may hold up to 32 megs each, and are only as large as the data
they are containing (They grow in size as you write to the virtual drive)

>
> XI. Can floppies be selectively disabled and rearrainged in the drive chai

Yes, you may either emulate one or both drives (even 5 1/4) and configure
which drive should be A or B in the Gemulator.

>chain? Do the ST seek rate settings (system vars) effect operation of the
>clone drives?

? I don't know.

>
> XII. Can gemulator boot from a TOS disk?

Yes, just like an original Atari ST. It can also boot from the hard drive.

Does it require the card to
>work? (your ad implied mobility of the package)

Yes and no once again. The emulator is entirely in software. The only thing
the hardware does is allow the ROM chips to be read in (similar to the
Magic Sac and Spectre cartridges). Theoretically, you could modify the
gemulator to load copies of the ROMS from disk instead, and avoid the hardware
entirely, but I have yet to see such a hack. Apparently it has been done
with the spectre (and no I do not have a copy, it is illegal)

>
> XIII. How fast will 'CPU' & 'graphics' speed be relative to a 520STe
>
> on a 486DLC-33
> a 486DX-40

I have a 486-33, and it runs about 1 1/4 to 1 1/2 the speed of a 1040ST

>
> both with ISA-bus & fairly generic VGA.
>
> XIV. Would a VL-bus video card speed up gemulator. If so, please give
>concrete examples & figures.

That's a hard question, since a VL card is not necessarily faster. Most
VGA cards today are accelerated cards, but usually are only specific
software packages, and require drivers to utilize the faster speeds. Many
times DOS programs do not show any or little speed increase. The Gemulator
does not include any drivers for accelerated cards. Darek included a
special copy of Quick ST the Atari software accelerator, and it will speed
up some graphic drawing routines for GEM.

>
> XV. Please give as complete as possible compatibility & incompatibility
>lists.

Of all the software, the only incompatibilities I have run into (aside
from the copy protection problem) is an older copy of FLASH! I have heard
other people using it, so it may just be my version. Also, since joysticks
are not supported at this time, for all practical purposes, any program
that uses one would be incompatible if there is not a mouse or keyboard
option.

P.S. I also have found incompatibilites with software that try to format
nonstandard track/sectors. It is probably related to the problem of why
most copy protected software will not work.

>
> XVI. Are there any plans for a TT, Falcon, or 030 emulator? (MultiTOS)
?????

>
> XVII. Can I access TT graphics models from the desktop. Can I switch bet
>between mono/color modes without restarting gemulator (as I would have to
>do on an ST)?

You do not have to restart the gemulator, but you will have to reboot the
emulated Atari session.

>
> XVIII. CAn you please give me a list of programs that utilize
>the extra screen size/res & colors. Also, if possible give me a list
>of programs that wont tolerate being run in non-ST/TT resolutions.

I have found that most programs will still run even in the oddball resolutions
but will only use a portion of the screen.
>
> XIV. Can the board physicall support more than one TOS chipset at
>a time & is the TOS in use easily switchable?

There are 8 ROM sockets on the gemulator board. I had both a 2 chipset TOS
and a 6 chipset TOS on board at the same time. Upon starting gemulator you
can select which TOS to install. Some cartridge ROMS may also bu plugged into
the board.

>
> XV. What kind of slot does the card use.

It uses an 8-bit slot.

Can Gemulator be used without
>the card/ROM & if so why not?

See XII.

>
> XVI. Is there any sort of executable demo for the clone that you could give
>give me?

Since it requires a hardware board, I know of no such demo.
>

Other answers to questions you didn't ask:

Q:Can I use the parallel port?
A:You can select either LPT1 or 2 to act as the emulated port.

Q:Will my Atari mouse accelerator work with the emulated mouse?
A:Yes

Q:Does gemulator require modifying an atari mouse to work?
A:No, it will work with any standard PC mouse. Atari mice are not supported

Q:Is sound supported?
A:If you have a Soundblaster(tm) or compatible card, sound is emulated.
(It could still use a little work though)

$49!!!!! I bought it as an upgrade to Omega I and it wasn't $49.
$149 maybe - I can't remember...

Anyway, I really enjoy Omega II. I believe Omega includes KCS (a
VERY powerful and flexible sequencer, but not exactly user-friendly),
Tiger, Song Editor (like Tiger, except it edits songs instead of
sequences), a Mixer module, some sort of score program, and some other
tools. Good manual too... Check out the Jan.94 edition of Keyboard
Magazine for the review of KCS 5.0 / Omega II.

It's a steal for $49...

VIJ...

457. Re: DOOM on the Jag

Newsgroup: comp.sys.atari.st

>In comp.sys.atari.st article <rjungCJ8pEB.8oE@netcom.com> you wrote:
>> None other. They predict the Jaguar version will surpass the PC version.
>>Much to the consternation of 3DO advocates, Id has also said they don't think
>>much of the $700 machine, and prefer Atari's $250 one...
>
>You wouldn't think much of the 3DO either if Atari had flown down and made you
>an "offer you cannot refuse" ;-)
>
>Atari bought ID off to make the DOOM version for Atari.

Firstly, your suggestion has not been supported by any statements I have seen. Until evidence to the contrary is shown, the sequence of events appears to be (1) Bill Rehbock sees DOOM on the PC, (2) Bill Rehbock talks to Id about a Jaguar version, (3) Id Software likes the Jaguar, (4) Id Software agrees to do a Jaguar port.

Secondly, your suggestion that Id was "bought off" doesn't jive. DOOM is going to appear for the 3DO -- it will simply be done by some other company that Id has licensed the game to. Id themselves do not want to write a 3DO version of their game, but will take the money they can make from it. B-)

Thirdly, your suggestion that the only reason Id is working on the Jaguar for monetary reasons contradicts public statements made about the Jaguar hardware:

"The Jaguar is a cooler, much cheaper machine with more flexible hardware. The only thing the 3DO has over it is a CD ROM."
--David Taylor

"I want to do a cool product even if it doesn't make tons of money. ...
"[The Jaguar] is the system I want to see become a standard platform. ...
"We finally decided that we didn't want to be a part of the chicken-and-the-egg problem of new systems not attracting customers because developers haven't written for the platform because there are no customers. The Jag is cool, I think it has a shot at success, and I am going to put my time where my mouth is."
--John Carmack

Even if Atari made Id a deal they "couldn't refuse", I doubt the guys at Id are complimenting the Jaguar hardware merely for the sake of getting some extra bonuses from Atari. Touch`e.

> Yeah, I've wondered for quite some time why ICD can't use PATCH or
> DIFF files on their PRO series of utilities. I realize they can't just

The biggest problem would be the fact that diff and patch work on text files, not binaries; patching binaries on the ST is pretty inefficient (either that or the tools just need some work). Add to that the fact that their utils are shipped compressed, and seem to act a bit weird when uncompressed (ex, the display of RATEHD is corrupted somewhat)...

> upload them to GEnie or the like since they don't require an ICD host to
> operate, but requiring me to mail in my master disk (and $10 I believe)
> for each upgrade is a little slack, since I was able to upgrade my old

I've never understood why the distribution of the ICD utils is so incredibly restrictive. I mean, the versions that requrie an ICD host to run... it's annoying to have to log onto GEnie (hmm, haven't done that in about four months now...) or call the ICD BBS to get the "latest" (and that's being charitable... they _still_ haven't fixed an annoying bug that affects the minix filesystem of MiNT... Stephen's stuck kluging around it).

>Hah! I see what the problem was. I was reading the 0index file on a.a.u.e
>and it wasn't there. It _is_ in the 0ls-lR.Z file.

I've ftp this too - and I must admit I'm pretty impressed. Its at least
as good as every other shareware network I've seen, and works under MTOS.

One problem I found so far is that if I have a TOS/TTP MINIWIN window
open I can't copy files onto that machine. Reading files and moving
around directories works fine. A loaded GEM program doesn't seem to cause
a problem.

Also under MTOS (but not under TOS) I can't reasign real drive letters to
other drives. I can create new fake drives fine.

Finaly I can't seem to network my CD-ROM drive (driven by the XFS driver).
The remote machine can't open the drive - but doesn't give an error.

:-)

Roland.

There are lots of serial fixes out there...but the combination you are using
would be hard to beat...you are locking the CTS in with the CPX aren't you.
I use Determ_M and Freeze Dried Term and download at aprox 1600 bps with
my Zoom modem. There probably isn't that much difference in the modems.
Check the phone line to the modem and all connections...just a suggestion.

>There are lots of serial fixes out there...but the combination you are using
>would be hard to beat...you are locking the CTS in with the CPX aren't you.

Yes, I am locking the CTS. Without it Z-Modem crashes after a couple of blocks. With it Z-Modem works like a charm, but text sometimes gets a little trashed. Would it help to increase the size of the ST's internal RS232 buffers?

>is, Robert, can you do an Atari port, or provide the source to someone!?

Dunno if we're talking about the same person, but I wrote to the guy
that wrote unarj ages ago, and he had discontinued using atari's then.
=======================

ARJ was originally written in fast assembly. Source code to Unarj was
released in C so other platforms could read the ARJ format (so that IBM
users would be dicouraged from using ARJ). The format of ARJ and the code
has been kept secret by the author - on purpose.

Hey guys! Don't go blowing up your Lynx.

An AdSpeed is only $100 and its much easier to install in an ST (especially since you would need a cache because the bus needs to be at 8Mhz). The Lynx is .. Hmm .. I don't know what processor. I thought a 68000, but perhaps its a 6502 like someone else said (that I find hard to swallow since the Lynx is 16 bit - I guess it could be a 65816 or whatever that 16-bit 6502 is called).

Ahh, but isn't DBII a commercial product!? The beauty of ARJ is that it is
shareware, although the compression is a bit naff compared to .lzh and .zip
algorithms, the extra options more than make up for it....

I've just put together a slightly customised falcon system.
I bought a 4 Meg Falcon from Silica for 699 pounds, then a
tower system from System solutions for 179.95, the Eagle 32
accelerator (Expandable with 32 Meg of fast ram, and no I
couldn't afford the ram yet), 213 Meg Maxtor 3 1/2 inch IDE
hard drive for 194 pounds, and an adaptor cable for power
and connection to the IDE for about 15 pounds. The Eagle 32
cost about 279.95 pounds. The system is now running Okay
but what I want to know is if anybody out there can give me
a list of the software I would have got if I'd bought a
Falcon with a hard disk already installed?

NOTE: I am posting this for friends, please respond ONLY to the
phone number given below. DO NOT SEND EMAIL OR POST REPLIES.

FOR SALE:

* Atari 1040ST
1MB RAM
Color Monitor (Atari)
3.5 floppy disk, disk eject sometimes sticks, but
otherwise the r/w functionality is O.K.

* Epson LX-800 9-pin printer
* Computer Cart
* Software
Word Writer ST
Swift Calc ST
Games
DAC Easy Accounting
Print Master Plus
* Joystick
* Disk caddy
* Mouse pad, computer covers, surge protector and power block.

Would like to sell the entire system for $475, buyer pays shipping.

Shipping arrangements: COD cash-only, UPS.

If interested, please call +1 209 897 7114.

477. Native sound format for the Atari?

Newsgroup: comp.sys.atari.st
Date: 1994-01-08 08:00:08 UTC
From: arcana@netcom.com
Message-ID: <arcanaCJAwwA.562@netcom.com>
Source record: 195473

I was wondering if anyone here could help me with a pretty basic question about Ataris: what's the native sound format that Ataris use? In other words, what's the one, most used sound format for the Atari (for system beeps, sound snippets, etc.). If you're wondering *why* I might be asking..you guessed it! I'm not an Atari user myself so I'm totally in the dark :-(

Actually out of curiousity, can all Ataris play sound without third party hardware??

Many thanks to all who reply (speaking of replying, if you're so kind to answer my Q. could you perhaps e-mail it to me...I don't frequent this newsgroup much). :-) I'd gladly exchange some Mac knowledge for your time! ;-)

-Jeremy

Rob,

It's _EASY_ to make menus tear away... although I've personally never desired to do so... Just move the mouse to the dropdown desired and Control left-click. Pop. There you have it.

So far as having things shift over 1/2 inch.... You've lost me, I've not run into that... I don't use Pinhead nor MiNT (although I wish I had the stuff to make a binary out of the latest sources, which I don't have either). Anyway, the current versions of Geneva don't work well with MiNT but it is supposed to be directly supported in an upcoming release so stay tuned.

TYL, Scott

I> limit

(Just my 2 cents .. )

I bought a normal VGA, which just happens to be quite good ... you never know
until you try ...

My monitor did 800*600 maximum on the PC system it was used on before .. with
BlowUp030 I'm running it at 1024*768i, 1024*768ni, 1280*960 and others ... the
BlowUp030 is VERY flexible, thus it's able to do a lot more with a normal VGA
than any other machine I've seen ..

(Note, my monitor does between 28-48kHz, and 45-125Hz, and should really be
called a MultiScan ... but it was sold as a VGA .... for those interested, it's
a DMC Super-MD3 .. )

480. Re: Calligrapher & DA Vektor

Newsgroup: comp.sys.atari.st
Date: 1994-01-08 08:55:32 UTC
From: djs@jet.uk
Message-ID: <1994Jan8.085532.24970@jet.uk>
Source record: 195476

In <1994Jan7.185614.27598@nessie.mcc.ac.uk> abi@sn2.ee.umist.ac.uk (Andrew Bianchi) writes:

>Hi ALL,

>I got Calligraphar (gold) last year, and I've just got DA Vektor,..
>a few problems with exporting/importing .GEM metafiles between the two !
GEM Metafiles are not, in general, the ideal output format for DA's Vektor. They can't cope with things like the TIFF fills for example. Unfortunately, with Calligrapher you don't have any other vector import. You could perhaps print the picture to a .IMG file then import that. Far from ideal, but at least it gets imported reliably.

>I created a nice 3D-extruded pound symbol which I wanted to import into a
>Calligrapher document, when I did the smooth curves got turned into
> sharp lines (YUCK !!!!!!)

>What I want to know is :

> * Can Calligrapher cope with bezier curves ??? (should it be able to ???)
You would think that it should, but it probably does not. It no longer uses GDOS, so upgrading to FontGDOS or SpeedoGDOS will not help. The upgrade to version 3 did improve it's metafile handling, after I finally convinced Working Title of a few bugs in version 2.

> * Does anyone *definitely* know if Calligrapher is being supported & updated
> (it has a lot of nice features - they just need debugging a little).
No, apparently Working Title have dropped the ST.

> * Can anyone recommend an alternative to Calligrapher (Pagestream, Papyrus
Don't know about Papyrus. Apart from that, there is no alternative really, as a document processor. PageStream will allow more sophisticated page layouts, but will not handle page cross referencing, indices, etc.

> * Are there any ftp sites with stuff for DA Vektor (fonts, drivers, etc) ???
> (I've already downloaded Calamus fonts from src.doc.ic.ac.uk)
CGS told me that they are mailing out info regarding upgrades to Vektor this month. The new version will include extra drivers (eg EPS). I have not seen any PD drivers anywhere.

There are zillions of PD PostScript fonts about; DA's Vektor includes a utility to convert them to Didot format, which it can use directly.

I recently (today) received my $99 LineLink 144e Modem from Micro Warehouse.
Since I got it from a PC dealer, I don't appear to have any problems with
it being set up for the mac. However I do need to know what I have to do
to have it work with my MSTE. I use STalker, and I also use STraight Fax
(version 2.0, or whichever one ISN'T an .ACC).

Any advice (here or in Email) would be greatly appreciated...

The part you are quoting is referring to Bison (1.19) from A.A. as
having a problem, not GCC or libs.

[errors delted]

>I certainly didn't get any of those errors - that last part compiled
>file, but failed on "prgflags 7 7 mint.prg". Does anyone knoe where I
>can find the program "prgflags"? I found a "flgset" program in the TT

>would "prgflags 7 7" do to my mint.prg anyway?

I don't know where to get it, but the prgflags.ttp would set the flags governing how the program is loaded into memory and where it allocates its memory. Since you don't have any fastRAM, it isn't necessary for your compilations (it isn't strictly necessary for _any_ compilations, but it is useful ...).

>I did alter my makefile a little bit - in addition to the -D's you
>have above, I added -mint and -DONLY030 (for my Falcon, after all!).

I don't think so since I have the -DMULTITOS, but I could be wrong.
The -DONLY030 sounds like a good idea - I'll add that while I'm figureing out this bug ....
>Well, I'm no expert but it seems to me that using -mint would help -
>it doesn't take that long to recompile! :-)

Well, if I had a Medusa and everything was in a RAM disk, you might be right. However, since I don't have a Medusa, it does take a while (but the ramdisk is something I'm taking a look into...when I know it works fine without it...).

>Also, I ran into an odd problem with bison - even though I had my
>YTABC and YTABH set to asm_tab.[ch], they came out as y.tab.c and

This is indeed interesting. In the fall/winter 1993 catalog
from Soundware (a music software vendor) Dr. T's has an ad for
Omega II that states SRP as $299!
I guess I'll have to call them to see what is up? By the way,
their phone number is 800-989-MIDI.
Does anybody else know what is going on here?

None other. They predict the Jaguar version will surpass the PC version.
Much to the consternation of 3DO advocates, Id has also said they don't think
much of the $700 machine, and prefer Atari's $250 one...

I forgot to add that I used CVG export from DA's Vektor to get stuff into
PageStream. The only problems with that are that you lost the TIFF fills
still (no alternative but to use TIFF output from Vektor), and you lost
colour. This last problem is a bug in the export of CVG from Vektor,
and CGS said that they are in the process of sending me a fix.

PageStream doesn't handle large bitmaps very well, so, provided one has
access to GhostScript or a PostScript printer, using EPS to communicate
between Vektor and PageStream will be the best bet.

That will probably be no good for English speaking/reading people.
I sent the english version to umich the other day.. should be there soon.

Yes, Mountain QWK is very good. But overall, I think all the QWK
readers suck badly.
They're all desigened to work on only _one_ news packet at a time, and
you can make up only one reply packet at a time.
What i'd like to see is one that has it's own news system of storing the
messages, and just keeps on adding packets to it, and lets you make
as many reply packets as you feel like.

The flexability in them in comparrison to the usenet news readers available
is non-existant.

Hello,
Does anybody out there have the specs for both the Medusa 040 and the GeSoft
Eagle? I'm inquiring for a friend.

Oh yeah, bI almost forgot...did Atari ever release any version of Unix for
the TT030? Any help would be greatly appreciated.

Hello,
I was wondering if there's still anyone out there who would like to share
tips and stuff for Time Bandits. I just really started playing this game and
have found several parts of it a little difficult to comprehend (ie the text
stuff). Also, I'm stuck in Dungeon Master (the best RPG ever written IMO).
Any help with these would be greatly appreciated!

Sorry Karl, Doom was developed on NeXT computers and ported to DOS. So NeXT
for Intel Processor was first, and a Black NeXT version is due out soon.
That makes 4 versions, NeXT FIP, DOS, NeXT Black, and Jag.

You wouldn't think much of the 3DO either if Atari had flown down and made you
an "offer you cannot refuse" ;-)

Atari bought ID off to make the DOOM version for Atari. Don't know the actual

deal, but by reading in the press, and comments from Atari, it seems that Atari

"just had to have Doom for the Jaguar" and "made it happen". $ talks.

340 MB is quite expensive for now. It's the maximum size anyway (for
now...)

Seagate and Conner 240 MB drives have come down in price quite a lot. Here
in Germany, an internal 240 MB 2,5" is cheaper than an external SCSI 3,5"
with cable and box.

Hi Jason,
JB>Does C't sell these gadgets already put together?
No, c't is a german magazine only.
You can get the PCB/GALs from eMedia, the supporter for c't hardware
projects or from
MW-Electronic,
Heisterbacher Str. 96,
FRG-53639 K/nigswinter

MW-Electronic sells complete PAKs, too, DM 695,- for a PAK with 32 MHz,
without FPU.

JB>I seem to remember something called a tos adapter board that only cost
JB>$20.
The PAK has got 32 Bit wide ROM sockets for TOS 2.06 or 3.06 (must be
patched patched for PAK), so you do'nt need a TOS-Card any more

Ciao, Steffen

O>>
O>>I am wondering if I should use FPATCH2 and/or BMAPFIX2. RIght now I am
O>>using both, but is only one necessary???
O>>

O>One should do, I use FPatch2. But maybe Don Maple can give more info.

In short: it does *not* hurt to run both FPATCH2 and BMAPFIX2! FPATCH2
for the DMA and BMAPFIX2 for the bconmap. For more info read on...

I missed the beginning of this thread (don't ask... gateway trouble...)
but as a rule of thumb: when it comes to Bconmap - BMAPFIX*2* does
everything FPATCH2 does AND MORE! Although, FPATCH2 has the DMA fix
as well. BTW, putting two *unrelated* fixes in the same program (as in
FPATCHx) is not very smart...

A bit of "hysterical" information ;-). FPATCH2 is based on the *old*
BMAPFIX (without 2). This has been overtaken by BMAPFIX*2*. When/If
Atari returns to the computer universe I expect FPATCH*3* will copy
BMAPFIX*2*... ;-)))

Also, I'd like to set the record straight re AEO_0222 *disinformation*
(they seem to ignore my email so I'll just do the laundry in public):

AEO> If a program such as a screen saver is expecting to talk to the MFP
AEO> when accessing Device 6, then there could be a problem when using
AEO> BMAPFIX2.

If an SS tries to talk to Falcon's MFP directly *nothing* will happen (no
input) since the MFP is not connected to the serial! On the other hand if
OS
```

calls are used everything will work just fine because it will be
redirected
to the SCC. Ergo, I don't see how a screen saver can experience problems!?
(Do note that I'm intentionally not complaining about programs tickling
the hardware directly ;-))

Anyway, to the original poster: feel free to send me email and I'll help
if I can.

Don

P.S. I'll post this twice from different sites to make sure it gets done.
Appologies for eventual duplication.

>
>The controller in the falcon is limited to around 1.1M a sec,
>_flat_strap_,
>depending on various annoying timing considerations. (NCR5380)

sigh, why is there always someone who never tried and still knows
better...

I have a Fujitsu M2622-512 hooked to our demo unit Falcon030 (stock 4/80
machine), and GEMDOS read access goes up to 1850 KB/s.
Quantum LPS 240 and Seagate 3600N drives also get that high, a 240 MB
Maxtor 7245S did 1450 KB/s, Syquest 3105S removable does 1400 KB/s.
Fastest on the Falcon was a HP 1 GB 3,5" drive doing 1900 KB/s through
GEMDOS.
For the TT (with FastRAM), it was a Quantum LPS 240 flying at 2200 KB/s.

(These are just the ones I remember, I tried loads more.)

1.1 meg/second is about the limit old STs have through GEMDOS. Falcon and
TT can do about twice the speed.

bye, Peter

This is the Straight Fax Speedo GDOS driver - it outputs each page
into a fax file, which you then can send with a fax program (like
Straight Fax). Straight Fax has a number of such drivers for various
programs - they work pretty well.

In short: it does *not* hurt to run both FPATCH2 and BMAPFIX2! FPATCH2
for the DMA and BMAPFIX2 for the bconmap. For more info read on...

I missed the beginning of this thread (don't ask... gateway trouble...)
but as a rule of thumb: when it comes to Bconmap - BMAPFIX*2* does
everything FPATCH2 does AND MORE! Although, FPATCH2 has the DMA fix
as well. BTW, putting two *unrelated* fixes in the same program (as in
FPATCHx) is not very smart...

A bit of "hysterical" information ;-). FPATCH2 is based on the *old*
BMAPFIX (without 2). This has been overtaken by BMAPFIX*2*. When/If
Atari returns to the computer universe I expect FPATCH*3* will copy
BMAPFIX*2*... ;-)))

Also, I'd like to set the record straight re AEO_0222 *disinformation*
(they seem to ignore my email so I'll just do the laundry in public):

AEO> If a program such as a screen saver is expecting to talk to the MFP
AEO> when accessing Device 6, then there could be a problem when using
AEO> BMAPFIX2.

If an SS tries to talk to Falcon's MFP directly *nothing* will happen (no
input) since the MFP is not connected to the serial! On the other hand if OS
calls are used everything will work just fine because it will be redirected
to the SCC. Ergo, I don't see how a screen saver can experience problems!?
(Do note that I'm intentionally not complaining about programs tickling
the hardware directly ;-))

Anyway, to the original poster: feel free to send me email and I'll help
if I can.

Don

P.S. I'll post this twice from different sites to make sure it gets done.
Appologies for eventual duplication.

You're right, you won't be able to run "all" programs needing an RGB-monitor.
You will, however, get rid of the unusable interlace of RGB-monitors, you will
be able to run all programs except demos without destroying your eyes as you
would by using the RGB... You will get higher usable resolutions... Nope, there
is no alternative to an SVGA, other than a MultiSync that can go as low as
15kHz, then you'll get the best of both worlds...they are not easy to find
these days unfortunately... Get an SVGA!!! Don't know about the 19" ;-(

I think there are at least one SIMM-board that can take 2Mb SIMMs, and 4 of
those SIMMS will give you 8Mb.... The one from GE-Soft I think was able to do
this.....

> For telecomunication software, what is a cheap FAX package for the

> information?

STraight Fax v2 seemed good, don't know where you can get it though...

> Onto games... Are there any that are falcon specific? what are they,
> how good are they????

Well... There are a few, Transarctica and Ishar II amongst others. More coming up... Don't know about the quality though ;-(

Since I don't do much programming I'll leave the other questions to those who know better! Cheers!

You are correct in assuming that I am speaking of the atari.archive.umich.edu
ftp site. Check out the Editors directory. MicroEmacs can be found in two
different versions on there. One is in the director ME3.12 or something like
that. The other is in a file something like MicroEMACS3.12.zoo.

Everest is in a file named something like evst150b.lzh.

Good luck.

Hello Gang,

I just wanted to state that since I've been using GENEVA I've grown to
love my Atari more. With all of the functionality of GENEVA, I don't know
how anyone could ever consider it "crap." It makes me wonder if the person
who called it so... if they every actually used it... and if so... if they
had any documentation... as there have been many times I've heard people
call a piece of software (and NOT just on the Atari platform) crap simply
because they weren't smart enough to buy the package with the benefits of
documentation.

The faq file shows how to hook up an external keyboard (Mega style) to a 520
and 1040. My 520 has a jack already on it for an external kb (aftermarket).
After comparing its wiring to the one in the faq, I realize that it is
identical. The faq gives no details of how to get an external Mega keyboard.
Does anyone have any suggestions where these could be purchased?

Are you sure this is an AVI player, not an AVS player? AFAIK AVI files are from
video for windows. If such a player exists for Atari ST or Falcon it would be
great, especially if source was available since that would finally allow some
useful Multimedia applications to be developed for the Falcon.

I have been using a Supra 2400 until recently. One of my friends at school
bought a LineLink 14.4k modem and let me borrow his Supra 2400 Plus. I like
this Supra 2400 Plus, but I seem to have some problems with flow control.

I know that the ST has some bugs with RTS/CTS, so I got Serial Fix 2 and the
CPX module to use with Flash 1.6. Using these, I have no problems d/l'ing with
Z-modem at 2400/REL-LAP-COMP (port set to 9600). I *DO* however have problems
with large amounts of text. If I do an extremely long directory listing or
VT100 movies or such, portions of the text will get lost at these high speeds.
I have also tried Storm 1.02 and the demo of Flash II with the same results.
With Storm, I get less data loss with the flow control set to Both than simply
RTS/CTS. Do I need the modem CPX as well? I understood that term programs
would overwrite your default settings using the modem CPX anyway.

Any help on this would be appreciated as I plan to get a LineLink soon myself,
and if the system can't keep up at 9600, I know it's gonna have problems with
19200.

Also, has anyone had any experience with the program on the umich ftp site
named HISPEED.LZH? It claims to patch Flash to use RTS/CTS properly.

I am getting ready to get a hard drive, and I have some questions about TOS
versions. I still have 1.0, and I know it has some bugs (archive bit, date,
etc.).

First of all, I need to know what programs should be used with a hard drive and
TOS 1.0 to speed it up and fix some of the bugs. I know about FATspeed,
Pinhead, and Copyfix. I also know there is some archive bit patch program (not
sure what it is, so I need to know it as well).

Secondly, I need to know about upgrading to a later version of TOS. When I
checked on TOS 1.4 a few years ago, I was informed that it cost $100, and it
had to be installed by a dealer (Atari's rules). I found someone who was
willing to ship me a copy anyway, but I didn't have $100. So, I never
upgraded. I am still looking to upgrade, but I understand that 2.06 is
available for the original ST's with an add-on board. I need to know sources
and prices for this board, TOS 1.4, and TOS 2.06. I also need to know about
the availability of switches allowing multiple TOS versions. I have the 6-chip
set in both of my ST's (520 ST and 1040 STf).

I know that some programs would not run on 1.4 since they used shortcuts. Were
there any that run under 1.4 but would not run under 2.06? Also, what were the
major changes in 2.06 from 1.4?

Thanks for any help you can give on these matters.
Hiram

I am getting ready to purchase a hard drive, and wanted to know more about DC
Data Diet. I understand it is a program like Stacker on the PC.

My question is how it works within the max partitions size under TOS. I know
that TOS 1.0 is limited to 16M partitions and TOS 1.4 is limited to 32M. Since
Data Diet effectively doubles the size of the drive, will the partitioning need
to be done differently or will it just double the effective size of the max
partition?

Also, how fast/compatible/etc. is it? In effect, is it worthwile to consider?
I am looking at anywhere from a 131 meg to a 270 meg drive, and wanted to try
and get it set up right from the very beginning.

Hiram

Nothing really, it's just it's color support under DOS is very limited compared
to it's support for Windows. It utilises a Windows screen driver to improve
things under windowss.

There is a Falcon happy version of Timeworks 2 on the way. Don't know when it
will be released though.

|> It must be able to print postscript to a file, it should have indexing
|> and cross referencing facilities, possibly vector graphics and possibly
|> some kind of equation editor.
Sounds like you need something like Calligrapher but that's been recently
dropped
by the author. Maybe someone else will take it over. I've heard rumours...

|> P.S. If anyone has any hints on how I can get Timeworks to work it
|> would be very helpful so I can try it out properly.
It wont work. Period.

} "latest" (and that's being charitable... they _still_ haven't fixed an
} annoying bug that affects the minix filesystem of MiNT... Stephen's
} stuck kluging around it).
}
[hits a raw nerve]

It might be annoying to you - it's almost impossible for me. Until a
kind person sent me version 5.5, I was using 5.1 for ages. I believe
there is a higher version available now....

It would be *nice* if they let an ftp site (or a bbs) somewhere other
than America distribute the software, especially since you can't use
it unless you've already got an ICD host adaptor; they can't be
afraid of piracy.

I guess they're afraid someone will put some fake software up and
when it crashes and burns, ICD'll get the blame. Still, anyone getting
HD drivers ought to make sure they'll work before trusting their HD
to them...

Simon.

Almost right... DOOM was developed under NeXTstep For Intel; the
NeXTstep version was out about a week before the DOS version.

You can buy two monitor plugs: One for SVGA (better get a Multiscan) with
Blow-up, and one for the RGB monitor (if you have an old Atari RGB monitor).

>(the clocks on Blowup
>and co only allow 800*600 at this rate), how hard would it be to make (or
>modify) an adaptor to support this rez?
In my experience, if the Blow-up doesn't support it, it can't be done.
I think you are bumping against BUS speed, not Blow-Up.
>Also, as far as an RCS, what would you recomend?
Interface. To my knowledge so far the only one that can do color icons.

> As far as music software is concerned, what is available? Has anybody
>tried DigiTape 2.0, Cubase Audio, or Notator Logic Audio, or dos anybody have
>information about these packages?
I haven't tried any of the above (can't afford them, yet), but try winrc from
a.a.u.e for some D2D recording with on-line effects. You should see people
on my last party laughing when they started playing with winrc's real time
pitch shifter :-)

Hah! I see what the problem was. I was reading the 0index file on a.a.u.e
and it wasn't there. It _is_ in the 0ls-lR.Z file.

Now alli I need is some MIDI cables.
Thanx!

The standard sound format is the AVR format.

You can also find some programs that play WAV or plain 8bit raw data.

Certainly there are programs like Fortune that can cope with SND, AU, WAV
AVR and DVS, too.

ATARI's System Audio manager for the Falcon uses AVR or WAV.

>Actually out of curiousity, can all Ataris play sound without third party
>hardware??

Yes, certainly. The STs only 'analog' sounds or rather bad digitized
sounds, the STE+TT 8bit stereo digitized, and the Falcon 16bit stereo.

I'm doing research on old computer systems, and am trying to track
down whatever system and/or disk product produced messages like the
following:

Phantom Error

Multiple Phantom Errors

Out of Range Errors

nn Tracks Added, mm Phantom Errors
[where nn and mm are numbers]

The common denominator seems to be the word "Phantom."

If you can possibly give me any clues, please reply by Internet mail.

Thanks in advance,
John

There is a twin-pack of games (I'll have to check the publisher, I don't have
them, my friend does) called MAY 1940 and BLITZKREIG. The two games cover
very similar periods and areas, but in the former the player is the Germans
and in the latter the Allies. These are the only games I've seen which have
a similar feel to Eastern Front.

PLUG: I will soon be releasing my Shareware wargaming system (two-player only).
It is a bit like SSI's old Wargame Construction Set but with the addition of
morale, facing, diagonal movement, objectives, user-definable terrain types
and various other innovations.
The program itself is finished, the only reason it hasn't been released yet is
that I'm still working on the documentation and example files. Anyone who is
interested in a copy is welcome to EMAIL for more details.

I have a typewriter (IBM 6715) connected via the serial port to my ST.
Setting the correct baud rate from the program requires power off at the
typewriter, otherwise it may react very strange. To prevent power on / power
of for each new call of this program I want to check the baud rate first
and if ok, the init of the serial interface could be skipped.
Therefore I need to know the baud rate currently set in my ST. I know that
for newer TOS versions it can be returned via the rsconf(), but my old TOS
version does not support this. Could someone please tell me how to search
for the baud rate? Is it hidden at a certain storage location or in one of
the control registers?

Thanks for your help, Bernd Hanses

Network ST International Association (NeST).
=============================================

Press Release Issue 008 (29/12/93)

What is NeST?
-------------

NeST (Network ST) is an international network based on FidoNet
technology, dedicated to the Atari range of computers, mainly to the
Atari ST and above.

The aim of the network is to provide messaging facilities to all
Atari users the world over who are interested in the world of
communications and in the ST.

Eventually it is planned that NeST will extend to virtually every
country in the world, however NeST now links the following countries:

The United Kingdom.
The United States of America.
Canada.
Australia.
Sweden.
Italy.
The Netherlands.
Germany.
Switzerland.
France.
Norway.
Denmark.
Luxembourg.
Singapore.
Belgium.

This is by far the largest ST dedicated network in the world, and it
is growing rapidly, with an average of a new country coming online each
month.

NeST members work closely together to generate a good atmosphere;
within NeST you will not find any political battles, something which
can't be said for a lot of other internets.

NeST also has a habit of collecting programers from every walk of
life, including some very well known names, who are either members of
the network itself, or affiliated with it.

- Mark Matts
- Auto FM
- GUI4GFA Suite
- TXT2Msg

NeST has a wealth of message and file echos, ninety percent of which are echo'd round the world, and replies can be achieved within three to four days. The message echo's cover a terrific range, running from software support (ACS, LED, JEKYLL, JETMail, MakeDiff, etc), programing (GFA, C, etc), and general interest echo's like the common room, and science fiction, or mind games.

Or if you are looking for something a little different why not take an interest in Space Empire Elite? The game runs throughout the network, using special programs coded by NeST members to coordinate and send inter-BBS attacks through the network.

NeST allows the use of almost any mailing software, be it F-Net/Crossnet, or fidonet technology, to be used to collect mail, giving a very flexible system of mailing. Point systems are given rights too, if they take a 'Pvt' address in the master NeSTList, they are allowed full participation in the network, again this is rarely allowed in other networks.

One item that worries some users, and sysops is cost, that is network fees for linking into the network itself. With NeST no such fees exist, as each member works freely to gain the best connections, minimising mail costs as much as possible.

If you want to join a network that's friendly, fun, well informed, and concious of what's going on, well why not try NeST, I don't think you'll regret it!

Get a Naksha mouse if you can. Someone asked this question on CIX recently and
got 15 odd replies saying Naksha and not one for any others!
System Solutions, Silica, just about anyone should be able to do one for you.

>except desktop.

Does it need to have a desktop specifically designed to handle the
multitasking
(like Geneva) or is it more just "running the the background" like MultiGEM?
(I have both, BTW)...

My one complaint about Geneva so far is that various software makes my
screen "shift" over about a half inch or so on a 13" monitor. In particular,
Pinhead and MiNT. I'm kinda curious as to why this is. Oh, BTW,
how does one "tear menus" under Geneva? (I know, I need to read the
manual, but it should be intuitive, right? :-)

Rob

...I find it fascinating that MGEM reminds me a bit of MultiFinder on the Mac,
and Geneva more like Windows (Taskman, etc)...

Hello!

I'm thinking of doing some music composition/midi sequencing in my spare time and am thinking of getting an Atari. Since I'm no where near ready to make the big leap to the Falcon030, I've decided to hunt around for a used 1MB STe (520, 1040, or even a Mega) for playing around with. Is anyone out there interested in selling their STe? Please reply by e-mail. Thanx!

But shouldn't the bus speed needed be the same for 640*480*8, 72hz and
1280*960*2, 72hz? (same amount of memory needed). at least the Falcon
should be able to handle 1280*960*1 ....

anyways, Bye, Bruno Schmidt

Yes, but can you actually GET a Tiny Turbo board? From what I was told
about 6 months ago, Fast Technologies was close to going under due to
getting bad parts. They were not filling orders which pissed off many
customers who had prepaid. Has this changed?

544. HELP needed - SLM 804 Laser Printer

Newsgroup: comp.sys.atari.st
Date: 1994-01-08 20:37:35 UTC
From: hkokko@ratol.ratol.fi
Message-ID: <1994Jan8.203735.1611@ousrvr.oulu.fi>
Source record: 195492

Is there a way to get a SLM 804 Laser Printer to emulate HPGL?
Emulation should be real-time and preferably redirected
(application prints to parallel port and printer is connected
to the DMA port)

This should work with these:

Atari MEGA ST2
Colour display (Low-res-mode!)

I would also like all information on the SLM 804 in general, because I'm
lacking the user manual...

I have the Epson-emulator LAZBRAIN already, and also a german software
called LPLOT, which does the trick to print HPGL-files (Hewlett-Packard
Graphics Language, used with plotters, for those who didn't know...)
But it is not real-time or redirected, one must read HPGL-files into the
program, watch them being drawn on the screen and finally have them printed.

Please help me with this! I would prefer mailed answers to:

hkokko@ratol.ratol.fi

PS: How do you guys (and gals) do those fancy address texts to the end of the
messages? Somehow I can't believe you write them over and over again...

545. French companies. Take 2

Salut tout le monde!

Why is it that "Start Micro Magazine" never prints the addresses of companies when reviewing their products?

For example, in Issue 13 (Janvier 1994) I'd like to know the addresses of the makers of "Big Boss Arrangeur" on page 61 and "Spectral Tool Kit" on page 67.

Any French Atari enthusiast that can help out there?

Merci!

Don

P.S. Feel free to pass this on to the editor of the mag at 3615 (I don't have Minitel).

>Falcon cannot access the extended Fast element ?

Yes, SCSI2 devices are sharing a common command set in which also SCSI1
is included.

>My interest is primarily though that I am looking for a SCSI2 for my ST
>and assuming I have a ICD Host am I also going to run into problem's on
>this score ? I have been looking at drives that are being called 'Fast
>SCSI2' since I assumed this was just an advertising adjective :-)

The ICD Host (and all others) are only offering SCSI1. With an the DMA Chip
of STs it's not possible to send commands of class 1. Using of SCSI2-
devices IS possible. I have three SCSI2 devices connected to my ICD. But
because you are restricted to command class 0 it is not possible to use
command like 'copy' which copies blocks directly from one device to another
without using the computer as sender/receiver.

Solved in the commercial version a demo of which will be posted within
three moths from now. It supports MiNT and MultiTOS in domain 1.

Cool. I'll have to try that out. Now I need a higher resolution so
that I can litter my screen with menus ;-)

> So far as having things shift over 1/2 inch.... You've lost me, I've
>not run into that... I don't use Pinhead nor MiNT (although I wish I had
>the stuff to make a binary out of the latest sources, which I don't have
>either). Anyway, the current versions of Geneva don't work well with
>MiNT but it is supposed to be directly supported in an upcoming release so
>stay tuned.

Well, I've gotten Geneva and MiNT to load and work at the same time,
but like I said, as soon as the AUTO programs are loaded, then my screen
"shifts" to the right a little bit (and the right side wraps around to
the left of the screen). I'm wondering if the TASKMAN.ACC is what's
causing this, because the shift does occur directly after the GENEVA.PRG
is loaded. It is rather annoying, because I'd like to have the tasking,
but also the MiNT (since a half of my hard disk is on minix partitions).

As for improvements, there are two things that would be nice.
A helpful improvement would be to have an option in Geneva to
set which desktop will be used as default (for instance, the ability
to say "DESKTOP=d:/gmni121e/gemini.app" for instance). Neodesk is nice,
but not my choice desktop.

Also, JARXXX.PRG is a bother to remember to load. It would be nice
for Geneva to see if there is already a cookie jar - if there is,
go on as usual. If not, then to do what Jar does and continue.
This is a minor complaint, but it doesn't seem overly necessary to
me to have two programs for this.

Rob

Thanks to all those lovely fluffy individuals who helped me with info on the
Atari Jaguar.

Anybody got anything on 3D0 or CD-I?

Pretty please :)

Are you *sure* you have the real version of Geneva, and not a pirate version? Most of the problems you're having are *really* basic!

JARXXX should basically just live in your AUTO folder, as it doesn't do any harm, all it does it give the machine a few extra cookie-entries (If you are running 20 programs, and each one puts a cookie in the jar, it'll overflow, JarXXX fixes this. I think it was recommended that JARXXX be set to something like 30 (e.g. JAR30.PRG), this was from one of the Gribnif folks on GEnie.

The default desktop in Geneva can easilly be changed, just get out your text editor, and load in the GEM.CNF (or GEM.INF) file, and edit the line saying

SHELL=C:\NEODESK\NEODESK3.EXE

to say

SHELL=C:\GEMINI2\GEMINI2.PRG

or whatever path and filename you wish your default desktop to be!

I don't even own Geneva and I've picked this little lot up from reading AEO and this base! (Who says USEnet isn't useful!? *grin*)

From: wells_s@ix.wcc.govt.nz
Message-ID: <2gnepb$qiv@golem.wcc.govt.nz>
Source record: 195498

Whenever I quit a program, and then go into another folder, and run
a GEM application (e.g. PRG or APP), the desktop claims that I can
only 'show or print this application' (e.g. it thinks it is non-executable)
then, after I select CANCEl, and double-click on it again, it runs
normally as it should do.

I've got a 4meg 520STE with TOS 1.6 (UK). This bug happens even with NO
TSR's. (And no, it's not a virus, I've been through all my disks twice)

A friend also said he used to get this problem, but hasn't had it lately.

Has anyone else had this? As it's getting REALLY annoying!

(I wonder if Atari has any plans to release a version of TOS with no
noticable bugs!? They STILL haven't fixed the RTS/CTS bug AFAIK and
how they missed the STE desktop.inf reading bug I don't know, does
Sam Tramiel work as their beta tester!?)

Gem SZRZ 2.28 (successor to the popular version 1.9) has been uploaded to
atari.archive.umich.edu, with the permission of the author. I have put a
readme file in the distribution that explains the contradiction concerning
the distribution statement in the author's documentation.

The author is currently selling version 4.0 of this program. If the increase
in quality from 1.9 to 2.28 is any indication, 4.0 should be incredible.
Purchase information is contained in the distribution file (gszrz228.lzh).

Unless the MSTe is unique is should be using SCSI drives, not IDE.
On my TT I have a 25 pin SCSI connector. Doesn't the MSTe have this also?

Lines: 45

Hi ALL,

I got Calligraphar (gold) last year, and I've just got DA Vektor, and I've now
got
a few problems with exporting/importing .GEM metafiles between the two !

DA Vektor seems to be working Ok and merrily exports and imports .GEM files. I
haven't got any program that can really test the files - I've just downloaded
GEMVIEW 3.0 from ftp.uni-kl.de to do just that (don't know when I'll get round
to trying it though).

I created a nice 3D-extruded pound symbol which I wanted to import into a
Calligrapher document, when I did the smooth curves got turned into sharp lines
(YUCK !!!!!!)

What I want to know is :

* Can Calligrapher cope with bezier curves ??? (should it be able to ???)

* Does anyone *definitely* know if Calligrapher is being supported & updated
(it has a lot of nice features - they just need debugging a little).

* Can anyone recommend an alternative to Calligrapher (Pagestream, Papyrus -
the
new HiSoft document processor, etc) ????

* Are there any ftp sites with stuff for DA Vektor (fonts, drivers, etc) ???
(I've already downloaded Calamus fonts from src.doc.ic.ac.uk)

Any help/comments/information concerning the above questions (or anything thats
related to them) will be gratefully recieved.

I can't always get access to comp.sys.atari.st so awnsers via e-mail would be
appreciated - any msgs I get I'll stick together and post here as soon as I
can.

Thanks in advance for any help,
Bye for now,

Andrew

I asked Codehead to email me the info files concerning the Warp9 3.80
upgrade (these were released in an lzh file on Genie and other places).
So, here you go.

Oh, the T-Shirts I asked John about are the cool ones with the CodeHead
logo (I think they say "We speak Assembly" on the back).

T-Shirts are available in turquoise or ash gray in a variety of sizes
for $10 (plus $3 shipping). If it accompanies an order, there will
only be one shipping charge.

I was wondering whether you could get file mail through GENie. I
guess not. Here are the two text files, back-to-back. The first is
called W9UPDATE.TXT and the second is EASY_UP.TXT:

For immediate release
```

CodeHeadQuarters
Friday, September 17, 1993

```
.................................................
: :
: CodeHead Technologies announces Warp 9 3.80 :
: :
: Including Extend-O-Pak :
: :
:...............................................:
```

The long-awaited upgrade to Warp 9 is here!

Feature List
---

o Fully compatible with the Falcon 030 computer.

o Fully compatible with SpeedoGDOS.

o Seven completely new Extend-O-Save modules!

o Seven of the previously-released modules have been enhanced, adding Falcon compatibility and new features, such as Alternate Screen, Test mode, Falcon "true color" support, and more.

o A newly-designed Warp 9 Control Panel provides easier access to all options and allows you to configure which page of features will appear upon the opening of the accessory.

o A new program, Extend-O-View, runs as an application for Extend-O-Save modules so that you can simply double-click on modules to load and view them! Or install Extend-O-Save modules right in your HotWire menu to select them with a single keypress or mouse click.

o A new accessory, EOS Timer, handles a new generation of Extend-O-Save modules which operate through the GEM event system. This allows modules to do disk access, and make many other types of system calls previously unavailable to Extend-O-Save modules. The Slide Show module mentioned below makes use of these new features.

o New MakeFast program provides users of TOS 1.0 and 1.2 a faster bootup of Warp 9.

o Now comes on two floppy disks containing over 1.3 megabytes worth of files. Disk two contains 20 Extend-O-Save modules from CodeHead Technologies and eight modules from other authors.

o Includes a 30-page manual addendum documenting all new features and Extend-O-Save modules.

New Extend-O-Save Modules

Slide Show - Picture files are displayed in an automatic slide show. The slide show displays pictures in any of the formats supported by Warp 9, including beautiful 256-color pictures on the Falcon 030.

Flying Thrones - A take-off on the popular Flying Toasters screensaver available on other platforms. Flying Thrones includes a separate program which allows you to load your own images/animations. Due to trademark restrictions, we can't release a clone of Flying Toasters, but now you can create your own version.

Rain, Man - Expanding circles appear on the screen, like drops of rain water hitting the ground.

Things That Go Bump... - The blinking eyes of various creatures randomly appear and disappear, accompanied by optional night sounds.

Spotlight - A circular section of the screen roams around a dark background as if a flashlight or searchlight were lighting it.

Filled Shapes - Random shapes with variable number of sides appear randomly, filled with random fill patterns.

RAM Page - The screen fills with an ASCII representation of the internal memory of your computer, providing page after page of interesting and unique screen displays. You might be surprised at what you've got inside -- and it's not Intel.

Availability

Warp 9 3.80 with Extend-O-Pak is available now. The retail price remains at $44.95. Owners of previous versions of Warp 9 can upgrade to v3.80 for $25 plus $3 shipping ($4 Canada, $6 overseas). Send us your master disk and $28 to receive the upgrade. For more information, contact your local dealer, or:

CodeHead Technologies
PO Box 74090

For immediate release

CodeHeadQuarters
Friday, October 7, 1993

.....
: :
: CodeHead Technologies announces :
: A New Update Policy for Warp 9 :

: :
:.....................................:

You asked and we listened!

Many of our customers have asked for an easier way to obtain their Warp 9 upgrades. Until now, we've required the return of your original disk in order to receive most upgrades.

Effective immediately, CodeHead Technologies will accept upgrade orders from registered owners of Warp 9 without the return of your original disk.

Upgrade orders may be placed in E-Mail on GEnie, Compuserve, Delphi, our own BBS, by phone, FAX, or mail. All that is required is that we have proof of your ownership of Warp 9 by one of the following means:

1. Inclusion in our database from your registration card.
2. Direct purchase with an invoice from CodeHead.
3. Return of original disk.
4. Receipt from a dealer showing Warp 9 purchase.

If you have any questions, give us a call. We value our customers' satisfaction and listen to your suggestions. The Warp 9 v3.80 upgrade is $25 plus $3 shipping ($4 Canada, $6 overseas). It comes on two disks, includes dozens of interesting and entertaining screensaver modules, and now has Falcon and SpeedoGDOS compatibility. For more information about the features of Warp 9 v3.80, read the online press release that was issued as W9UPDATE.TXT on September 17, 1993.

For more information, contact:

Data Diet, by Double Click. They may be out of business, however. Toad
might have it (1-800-448-TOAD).

Mag!X is ca. 150 kB long, has it's own desktop (but just a simple one).
you can use an alternative desktop e.g. neodesk, gemini (in germany
Mag!X 2.0 is sold together with EASE (which can use Kobold for copying,
deleting, etc).
you can terminate any process at any time or switch between them
(except if you are in single mode (necessary for old progs)).
and it is pretty fast even on my 1040st (68000 proc.)

so for a multitasking enviroment it is a pretty good choice!

Source record: 195500

>I've ftp this too - and I must admit I'm pretty impressed. Its at least
>as good as every other shareware network I've seen, and works under MTOS.

Another couple of hours playing - and a few more problems.

Under MTOS the computers don't seem to stay in sync. If I copy a file onto a remote drive, I have to use the MKNET.APP program to explicitly do a media change before the ST that *owns* the drive can actually see it. No amount of <ESC> or opening or closing windows will do. Its not the desktop or the ICD buffers as I've turned them off and tried it from a shell.

Also there seems to be at least one file missing from the archive:

- MKNT.TTP is completely NEW ! With it you can change configuration from batch. Actually the following options are available, and each option is executed in sequence, so that you can display the configuration with -? several times during execution, like this :"-? -ong -xgc -? -rg -? -offg -onp -?", note that case in NOT significant.

Finally does anybody know what the following statement is getting at, specifically the bit about MiNT and Global memory?

- MKNT.PRG is the TSR you have to run to install the network. You can do it from the desktop (also with MiNt if allocating to global memory) or putting it as your last program in AUTO folder.

Very finally - has anybody registered this program (or using it in anyway)?

Thanks

Roland.

Agreed.

On the topic of QWK readers, does anyone have any idea where to find
IMHO version 1.06. If not could someone (perhaps in the UK) upload it to
a FTP site somewhere.

Cheers,

After I posted a while ago asking if the groups should be dissolved, several
people stepped forward volunteering to moderate. I'm happy to report that
one of them is just about ready to start, so as of now I'm stepping down as
moderator.

Please welcome Annius Groenink, avg@cwi.nl, to both groups. Under enthusiastic
new management, I hope the groups will take on new life. I'll continue to
hang around both groups in an advisory capacity for a while, but this is
probably the last posting you'll see from me here.

All new submissions should be sent to the abovementioned E-mail address,
and you should adjust your moderators or mailpaths file accordingly until
the change is reflected in the List of Moderators maintained at Uunet.
The archives will remain at ftp.hyperion.com until I can find another home
for them (any volunteers?)

I'd like to thank everyone who participated over the years, both readers
and submitters. It's been an interesting ride.

See you all on the net!

-Steve

>configurable as it is on the Spectre or is it allocated as needed.

You can select the Gemulator to emulate a 512K, 1040K, 2048K, or 4096K
ST at boot up

>
>
>II. What would the memory overhead to the rest of the system for
>GEMulator running with a 1Meg ST session?

Are you going to multitask? If so I have been able to run the Gemulator
emulating a 4 meg machine under OS/2 with no problem. I do have 8 megs of RAM
on my PC. It can also run under windows, but I have been unhappy with the
results, it seems to be too sluggish.

>
> III. Can autobooting software run on it? Something like Street Fighter IIi 2
>or World Karate Championship?

Gemulator will not work with most copy protected disks. It reads and writes all the flavors of the TOS format with no problems otherwise. My guess that most of your games will not work for this reason.

>\
> IV. Could a relatively well behaved game run on it? Will Populous 2 or
>Sim City run on it?
As long as it is not copy protected, the Gemulator emulates all the hardware of the Atari (less joysticks [should be in next upgrade] and MIDI ports)
>
> V. Can the GEMulator access the joystick ports? If so how does the an
>analog stick get used by the GEMulator ST?

See above

>
> VI. Is linea supported.

Yes. all systems calls are supported.

>
> VII. Are all system addressed supported including IO registers.
>(context--hardware carrier detect routine)

Yup.

>
> VIII. Are internal modems accessable? Would an RS-422 be accessable? Would☐☐

It depends on your modem. The Gemulator allows you to use either com port 1 or 2 to act as the emulated serial port. As long as your modem uses either of the two com ports, it should work fine.

>Would devices attached to an external SCSI port onthe clone be accessable?

Only the hard drive as far as I know.

>
> IX. Can it run under DOS? OS2? Windows? WindowsNT?...
> or even GEM (clone version) '-)

I'v successfully run it under DOS, Windows (a little too sluggish, but it works), and OS/2. I'm not sure about GEM for the PC. (I don't know anyone who has it anymore)

>
> X. Can GEMulator boot from a DOS partition.

Yes and know. A DOS partition can be larger than the 32 meg partition limit on the Atari. If you partition your PC drive so that the first partition is 32 megs or less, you may access it directly. Otherwise, writing directly to the hard drive could be destuctive to your PC data.

Up to 4 virtual hard drives are supported however, and they may reside anywhere on your hard drive. I like the virtual drives since I can use PKZIP to compress and backup an entire hard drive in one file. Virtual

hard drives may hold up to 32 megs each, and are only as large as the data they are containing (They grow in size as you write to the virtual drive)

>
> XI. Can floppies be selectively disabled and rearrainged in the drive chai

Yes, you may either emulate one or both drives (even 5 1/4) and configure which drive should be A or B in the Gemulator.

>chain? Do the ST seek rate settings (system vars) effect operation of the
>clone drives?

? I don't know.

>
> XII. Can gemulator boot from a TOS disk?

Yes, just like an original Atari ST. It can also boot from the hard drive.

Does it require the card to
>work? (your ad implied mobility of the package)

Yes and no once again. The emulator is entirely in software. The only thing the hardware does is allow the ROM chips to be read in (similar to the Magic Sac and Spectre cartridges). Theoretically, you could modify the gemulator to load copies of the ROMS from disk instead, and avoid the hardware entirely, but I have yet to see such a hack. Apparently it has been done with the spectre (and no I do not have a copy, it is illegal)

>
> XIII. How fast will 'CPU' & 'graphics' speed be relative to a 520STe
>
> on a 486DLC-33
> a 486DX-40

I have a 486-33, and it runs about 1 1/4 to 1 1/2 the speed of a 1040ST

>
> both with ISA-bus & fairly generic VGA.
>
> XIV. Would a VL-bus video card speed up gemulator. If so, please give
>concrete examples & figures.

That's a hard question, since a VL card is not necessarily faster. Most VGA cards today are accelerated cards, but usually are only specific software packages, and require drivers to utilize the faster speeds. Many times DOS programs do not show any or little speed increase. The Gemulator does not include any drivers for accelerated cards. Darek included a special copy of Quick ST the Atari software accelerator, and it will speed up some graphic drawing routines for GEM.

>
> XV. Please give as complete as possible compatibility & incompatibility
>lists.

Of all the software, the only incompatibilities I have run into (aside
from the copy protection problem) is an older copy of FLASH! I have heard
other people using it, so it may just be my version. Also, since joysticks
are not supported at this time, for all practical purposes, any program
that uses one would be incompatible if there is not a mouse or keyboard
option.

P.S. I also have found incompatibilites with software that try to format
nonstandard track/sectors. It is probably related to the problem of why
most copy protected software will not work.

>
> XVI. Are there any plans for a TT, Falcon, or 030 emulator? (MultiTOS)
?????
>
> XVII. Can I access TT graphics models from the desktop. Can I switch bet
>between mono/color modes without restarting gemulator (as I would have to
>do on an ST)?

You do not have to restart the gemulator, but you will have to reboot the
emulated Atari session.

>
> XVIII. CAn you please give me a list of programs that utilize
>the extra screen size/res & colors. Also, if possible give me a list
>of programs that wont tolerate being run in non-ST/TT resolutions.

I have found that most programs will still run even in the oddball resolutions
but will only use a portion of the screen.
>
> XIV. Can the board physicall support more than one TOS chipset at
>a time & is the TOS in use easily switchable?

There are 8 ROM sockets on the gemulator board. I had both a 2 chipset TOS
and a 6 chipset TOS on board at the same time. Upon starting gemulator you
can select which TOS to install. Some cartridge ROMS may also bu plugged into
the board.

>
> XV. What kind of slot does the card use.

It uses an 8-bit slot.

Can Gemulator be used without
>the card/ROM & if so why not?

See XII.

>
> XVI. Is there any sort of executable demo for the clone that you could give
>give me?

Since it requires a hardware board, I know of no such demo.
>

Other answers to questions you didn't ask:

Q:Can I use the parallel port?
A:You can select either LPT1 or 2 to act as the emulated port.

Q:Will my Atari mouse accelerator work with the emulated mouse?
A:Yes

Q:Does gemulator require modifying an atari mouse to work?
A:No, it will work with any standard PC mouse. Atari mice are not supported

Q:Is sound supported?
A:If you have a Soundblaster(tm) or compatible card, sound is emulated.
(It could still use a little work though)

I offered to donate ICD a couple of megabytes of ftp-accessable file space
to use for distribution of their semi-controlled software, just to make
update easier to get for Internet folks. I have yet to hear back from them.

BTW, the latest ICD non-pro software that I know of is version 6.2.2.

Memory serves right. TOAD ad in Nov 93 Current Notes: NVDI - $79. If you
know of a place that sells it for $40, please post the address/phone number.
The high price (and the fact that I have already invested money in Warp9)
is what has prevented me from buying it up until now.

Hi Hiram..

Get TOS 1.4, then the Archive bit works ok, I think DC did a patch for it,
I have the developers docs on TOS 1.4, there are over 2 pages of fixes
to tos 1.4, you can't do all this with patch programs...

It was none other than "Daron Brewood" that wrote on the 2 Jan 94 that ,
"B> BTW whilst talking about AUTO programs, should GEMRAM, W!nx, and
"B> SH_BUF go at the front of the AUTO folder? At the moment I've got
"B> GEMRAM and W!nx just after XBOOT, and SH_BUF at the end of the
"B> files.
That's how i've got them lined up . I think it's best to have GEMRAM and
Win!X run before anything else but since SH_Buf only patch's the Newdesk
file I don't think I need's to be run until last. The problem I haven't
been able to fix is where does Mint come in all this ? I beleive they can
co-exist but I haven't been able to get it to happen.

I just recently figured out the solution to a similar problem I have been having. For me, all terminal programs would drop characters at high speed (9600 and 14400 modems, port set to 19200) except for Uniterm. At first, I thought that Warp9 was the culprit. I was also told that the blitter chip can do this (in Mega's). It turns out that the problem was with my auto folder programs. I had bound various digital samples to my keys with click.prg. That, combined with all the other stuff I have tied to various interrupts, was enough to cause character lossage. Various symptoms lead me to believe that click.prg is not the specific culprit, just too many interrupt-tied thingies for an 8mHz 68000 to handle along with a high speed serial connection.

So, I suggest you try turning off most of the stuff in your auto folder. I recommend HSMODEM1, as it gives faster Zmodem downloads than Serial Fix 2. If you have a blitter, you might try turning it off. Or, you can use Uniterm :-). I have flow control set to RTS/CTS only, by the way.

After solving this problem, I started looking for a replacement for Uniterm. Connect was the big contender. However, it was not as fast as Uniterm with my setup (I have Warp9, which is apparently not as good as NVDI with respect to Connect in particular, and perhaps in general). Even with NVDI, I would still have to live with a small font in a GEM window. So, for now I am going to stick with Uniterm on my Mega2ST. If I were running MTOS or MINT, I would perhaps feel differently about the GEM window usage, but for TOS the use of the full screen in character mode is easier for me to look at for long periods of time.

Uniterm, combined with GSZRZ 2.28 (to provide fast Zmodem capability), still gives me the best UNIX dialup capability for my ST (I log into my machines for several hours every day). With Uniterm, you don't need the CPX, BTW.

Flash 1.6 was a great program for its time, but it really is kind of clunky compared to various shareware and freeware offerings out today. It is certainly not the best choice for high speed modem use. Grab Connect and Uniterm and give them a try for a few days (STorm looks promising as well).

Hope this helps.

$49!!!!! I bought it as an upgrade to Omega I and it wasn't $49.
$149 maybe - I can't remember...

Anyway, I really enjoy Omega II. I believe Omega includes KCS (a
VERY powerful and flexible sequencer, but not exactly user-friendly),
Tiger, Song Editor (like Tiger, except it edits songs instead of
sequences), a Mixer module, some sort of score program, and some other
tools. Good manual too... Check out the Jan.94 edition of Keyboard
Magazine for the review of KCS 5.0 / Omega II.

It's a steal for $49...

There are lots of serial fixes out there...but the combination you are using
would be hard to beat...you are locking the CTS in with the CPX aren't you.
I use Determ_M and Freeze Dried Term and download at aprox 1600 bps with
my Zoom modem. There probably isn't that much difference in the modems.
Check the phone line to the modem and all connections...just a suggestion.

In article <1994Jan7.052636.12589@pagesat.com> smh@netserv.com writes:
>In comp.sys.atari.st article <rjungCJ8pEB.8oE@netcom.com> you wrote:
>> None other. They predict the Jaguar version will surpass the PC version.
>>Much to the consternation of 3DO advocates, Id has also said they don't think
>>much of the $700 machine, and prefer Atari's $250 one...
>
>You wouldn't think much of the 3DO either if Atari had flown down and made you
>an "offer you cannot refuse" ;-)
>
>Atari bought ID off to make the DOOM version for Atari.

Firstly, your suggestion has not been supported by any statements I have
seen. Until evidence to the contrary is shown, the sequence of events
appears to be (1) Bill Rehbock sees DOOM on the PC, (2) Bill Rehbock talks to
Id about a Jaguar version, (3) Id Software likes the Jaguar, (4) Id Software
agrees to do a Jaguar port.

Secondly, your suggestion that Id was "bought off" doesn't jive. DOOM is
going to appear for the 3DO -- it will simply be done by some other company
that Id has licensed the game to. Id themselves do not want to write a 3DO
version of their game, but will take the money they can make from it. B-)

Thirdly, your suggestion that the only reason Id is working on the Jaguar
for monetary reasons contradicts public statements made about the Jaguar
hardware:

"The Jaguar is a cooler, much cheaper machine with more flexible hardware.
The only thing the 3DO has over it is a CD ROM."
--David Taylor

"I want to do a cool product even if it doesn't make tons of money. ...
"[The Jaguar] is the system I want to see become a standard platform. ...
"We finally decided that we didn't want to be a part of the chicken-and-

the-egg problem of new systems not attracting customers because developers haven't written for the platform because there are no customers. The Jag is cool, I think it has a shot at success, and I am going to put my time where my mouth is."
--John Carmack

Even if Atari made Id a deal they "couldn't refuse", I doubt the guys at Id are complimenting the Jaguar hardware merely for the sake of getting some extra bonuses from Atari. Touch`e.

Source record: 195154
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I have a problem that I hope someone can help me with.

MasterBrowse currently has a client-program that works with MultiTOS.
It does not work with Geneva, and probably will not work with Mag!X,
since neither of them support pipes. I would like to modify the
client program so that it relies entirely on passing GEM AES
messages. To do this, I have to be able to pass the filename from
the client-program to MasterBrowse, which requires passing the
address of a string. I know (roughly) how to do this, but I need
to know how I can make the chunk of memory holding the filename
global-readable (so that the client-program will still work with
memory protected systems). I believe that there is a system-level
GemDos call that will do this, but I do not remember the name of
it or the calling convention.

If someone could send me an electronic mail message telling me the
name of the call and how to use it, I would really appreciate it.

Anyone out there have opinions on tape drives for hard drive backups
for the ST's? Specifically, stuff that will work with a AdSCSI+.
I'm tired of backing up to floppy (especially since I just got a 245 MB
drive). Any specific brands? Any specific software? DAT or cartridge
tape (DAT's nice becuase the price is small for a tape, but how about
the price of the drives?)?

I used to have this problem all the time. I also used to only be able to
have about 100 files in a folder. And I also had TOS version 1.6 (not
1.62 - the sereial number on my 1040STe is something like 56 or so).
I think it may have been bad ROMs, becuase when I upgraded to 2.06, all
the problems went away. My advice - get new ROMs, 2.06 is so much nicer
than 1.6 anyway.

>Umm, try switching the CPX into LOCK mode and see if that makes any
> difference?

I already have the Serial Fix CPX in Lock mode. My question was did I also need to run the modem CPX and set it for RTS/CTS. From my understanding, term programs that have their own setup disregard the setting in modem cpx anyway. With the Serial Fix CPX locked, it works better than without, but I still get lost info on large amounts of data even in programs that support RTS/CTS.

In article <2gnsb9$mrr@mailer.fsu.edu>, boyd@gauss.math.fsu.edu (Mickey Boyd) writes:
>So, I suggest you try turning off most of the stuff in your auto folder.
>I recommend HSMODEM1, as it gives faster Zmodem downloads than Serial Fix 2.
>If you have a blitter, you might try turning it off. Or, you can use
>Uniterm :-). I have flow control set to RTS/CTS only, by the way.

This could be it although I don't think I have that much in my auto folder...

```
; AUTO Programs
PINHEAD.PRG
AUTOKWIK.PRG
FGSTIM21.PRG
COPYFIX.PRG
MACCEL3.PRG
DCMSHIFT.PRG
DESKMG33.PRG
UIS_III.PRG
DCSHOWIT.PRG
DCMOUSER.PRG
```

>After solving this problem, I started looking for a replacement for Uniterm.
>Connect was the big contender. However, it was not as fast as Uniterm with
>my setup (I have Warp9, which is apparently not as good as NVDI with respect
>to Connect in particular, and perhaps in general). Even with NVDI, I would
>still have to live with a small font in a GEM window. So, for now I am going
>to stick with Uniterm on my Mega2ST. If I were running MTOS or MINT, I would
>perhaps feel differently about the GEM window usage, but for TOS the use of
>the full screen in character mode is easier for me to look at for long
>periods of time.

Well, I tried Connect 2.20, and was not crazy about it for the same reasons you mentioned. I originally tried it for its TEK4010 emulation, then I found out that PROBE (part of the PSPICE circuit analysis package) doesn't function properly on TEK displays. I even tried it in the lab with the Graphon 240 terms (which also emulate TEK4010's) and it didn't work. I may try 2.42 as I hear there have been significant changes.

>Uniterm, combined with GSZRZ 2.28 (to provide fast Zmodem capability), still
>gives me the best UNIX dialup capability for my ST (I log into my machines
>for several hours every day). With Uniterm, you don't need the CPX, BTW.

I've been meaning to try Uniterm for some time, maybe it's time... <g> I'm still waiting for GSZRZ 2.28 to be cleared on umich. Gonna check again after I get done with news. I also log in every day for several hours on our VAX (VMS).

>Flash 1.6 was a great program for its time, but it really is kind of clunky
>compared to various shareware and freeware offerings out today. It is
>certainly not the best choice for high speed modem use. Grab Connect and
>Uniterm and give them a try for a few days (STorm looks promising as well).
>Hope this helps.

Yeah, but compared to most of the things that I've tried so far, it still has
more functionality. Storm has the same problem as Flash with my setup.

Steve Wells did willfully write on 09 Jan 94 (to All), and I quote...
SW> From: wells_s@ix.wcc.govt.nz (Steve Wells)
SW>
SW> Whenever I quit a program, and then go into another folder, and run
SW> a GEM application (e.g. PRG or APP), the desktop claims that I can
SW> only 'show or print this application' (e.g. it thinks it is non-
SW> executable) then, after I select CANCEl, and double-click on it again,
SW> it runs normally as it should do.

This effect turned up as of TOS 1.4 already, and is I believe a result of the mouse/click handling routines being rewritten. There are a few patches out to fix the "click" bug, although these usually refer to the related symptom of clicks on he scrollbar advancing twice. Essentially this seems to be a timing problem between faster mouse handler and the slower GEM AES event handler. Apart from patch, the problem usually goes away if other shells are used (I recommend Neodesk - I've never encountered it there) or perhaps if other fix/patch/enhancements intercept mouse events.

SW> [...]
SW> (I wonder if Atari has any plans to release a version of TOS with no
SW> noticable bugs!? They STILL haven't fixed the RTS/CTS bug AFAIK

The ST/STE RTS/CTS-bug is at bottom a hardware problem related to interrupt priority, not a TOS one, though the early TS versions have had (different) additional bugs which have confused the issue. There are software workarounds (fixes) which allow reasonably reliable 19200 bps, but unless the hardware is changed (Falcon?), a newer TOS will not in itself help.

Hiram Lester, did willfully write on 09 Jan 94 (to All), and I quote...
HL> [...]
HL> With the Serial Fix CPX locked, it works better than without, but I
HL> still get lost info on large amounts of data even in programs that
HL> support RTS/CTS. [...]

Two things might help:
- larger RS232 buffer (4K, 8K - a number of utulities give this, but beware that some communication programs set their own, eg Flash, so that such a utulity must then be run from within the term.prog (ACC or external) to have any practical effect.
- greater difference between RS232 bps and modem line connect speed. High speed modems invariably use MNP% or V.42bis compression, and especially on transfer of uncompressed material at 14400 bps, you might actually need upwards of 30 kbps between computer and modem to keep up. Obviously with max 19200 bps, and insufficient buffering, some text will be trashed in a case like this unless compression is disabled. Even zip or lzh files can occasionally show over 100% effeciency transfer due to transitional compression gains, and thus get faulty CRC for certain blocks if one runs with identical RS232 and modem connect speeds.

True, but one would expect that since shareware does not require
packaging, a distributor who needs to make a profit off distributing
it, a dealer who needs to make a profit off its sale, and no
advertising since its "free" distribution is its means for that, that
one should not pay more than a comparable commercial package (if one
exists).

>been able to fix is where does Mint come in all this ? I beleive they can
>co-exist but I haven't been able to get it to happen.

I've now switched from GEMRAM to using ROMSpeed which works a hell of a
lot better, with less incompatability problems all round. To get MiNT
working just stuff it right at the end after SH_BUF.

I run in this order in my auto Folder:

BOOTKILL
XBOOT
JAR100
DESKPIC
ROMSPEED
WINX
ENVIRON
FOLDR40
FPATCH2
BMAPFIX2
LETEMFLY
FAST_SER
SLECTRIC
NVDI
NVDIFIX
BLOWBOOT
DMIRROR
CACHEV4
SILKMOUS
SHBUF16
SAM

Works just fine fo me with the folling ACC's; FuzzyClock, SAM Setup,
DeskPic, BLow030, and Xcontrol.

Still leaves me with 11.27 megs free memory.

>Are you *sure* you have the real version of Geneva, and not a pirate
>version? Most of the problems you're having are *really* basic!

Nope - real live, legitimate copy bought (with Neodesk) from Toad
Computers. Actually, I think I've tracked the problem down a little
bit. Normally I run in ST HI resolution - this is where these
problems occur (the screen shift) when I load certain other
programs). However, I've been messing with Geneva in ST MEDIUM,
and this problem does *not* occur in that mode. Pretty weird...

About the only MiNT incompatibility I can see in both modes is the fact that
programs complain that they can't find their RSC files when MiNT is
in memory. I've tried playing with the PATH, but no go so far...

>JARXXX should basically just live in your AUTO folder, as it doesn't

I suppose the overflow thing is cool enough. Since my MSTe
already had a cookie jar, that was why I thought JAR was overkill...

> the price of the drives?)?

I was just getting ready to post a similar request. I'll mention what little
I know about the subject, and hope the resulting thread enlightens us both :-).

Ok, as for SCSI tape drives working with your ICD host adaptor, I believe
the answer is "no problem". They are SCSI devices, after all. The problem
becomes one of software, in particular something that can talk to the tape
device and get it to jump through hoops for you. I have heard of three
options, but there are undoubtedly more.

1. Beckenmyer Development tape package. This is a commercial software
product that enables one to use several different brands of tape drive.
I'm not sure if it is a touchie feelie GEM thing, or just .ttp programs.

2. tapebios.lzh. A freeware/shareware (can't remember) set of drivers and
ttp programs. I believe they offer a UNIX style tar or cpio interface.

3. gnutar. I seem to remember someone mentioning a port of gnutar that
worked with SCSI tapes on the ST. I'm not sure if other stuff is required.

My personal preference would be gnutar, as I use this fine package all the
time on various platforms. It is much easier to use than standard UNIX
tars, as it supports both the standard and an extended command line set
(the extended is pretty idiot proof, though a bit verbose).

There are probably about three likely candidates for SCSI tape drive types:
QIC-150, QIC-24, and QIC-11. QIC-150 is perhaps the most popular, and
holds 150mb on a tape. The other two are older designs. One holds about
60-80mb per tape, and I'm not sure about the other. DAT would be interesting,
as would Exabyte, but for the drive sizes normally encountered on STs I
think cartridges are more practical (i.e. if there were DAT/Exabyte drivers I
would be surprised, but pleased <grin>).

Anyone knowing more about any of the three things above (or additional
strategies), please post! If there is interest, I can put together a
summary and make it available via ftp, for future occurances of the
same question.

In the past, I have used two syquest cartridges (44mb each) to back up my
85mb primary hard drive. This works wonderfully! I use Diamond Edge to

do defrag partition copies, and it is incredibly fast (this is a low level
partition copy, where both drives are blinking away at the same time).
It takes me about half an hour to back up the whole disk (which is usually
quite full), including time spent dorking around with labels and such. I
still intend to do this, but I want to have long term archival storage as
well, in addition to the ability to back up other Syquest cartridges. A
SCSI tape seem to be ideal.

That's probably due to the fact that QWK packets and readers originated on DOS machines; the architecture severly limits the software. Even Windows software has silly limitations (like this one, for ex)... then again, it's still suffering under 64k segments...

There was a QWK->News converter on alt.sources many moons ago... unforunately, there was no support for extracting replies and dumping them into a reply QWK packet.

>TT can do about twice the speed.

I use a 120Mb Maxtor on my ST (TOS 1.4 w/ 16MHz kit) via ICD's hardware,
and I get approximately 1200KB/s throughput according to ICD's RATEHD
program. I plugged the same drive into a Falcon using a SCSI<->Centronics
cable, and got barely more than 800KB/s throughput using the same
benchmark software.

The "maximum res" you will get out of that monitor will depend entirely
on the vertical and horizontal refresh rates which will, obviously,
vary from brand to brand. The only way to know is to try it...

(Tape backup H/W and S/W)

Perhaps GEMAR may also be of interest, I believe v2.0 is the latest
and has English RSC and DOC files. It is shareware from Germany for
ST/TT/Falcon, and caters for several different types of SCSI tape
streamers. I have seen GEMAR v2.0 and it looks IMHO to
be very powerfull and comprehensive, and the registered version offers
additional features.

Yeah, tell me about it another very raw nerve here. I have ultimately got
hold of the later ICD versions (yes I do have an ICD host adapter). I wouldn't
mind so much if there weren't so many bugs in it I have to work round for
Minixfs.
Still I don't like to leave people with unusable systems, it seems I
must care more for ICD customers than ICD does.
Steve.

: Data Diet. I understand it is a program like Stacker on the PC.

This is true. DC Data diet was _supposed_ to provide exactly this
revolution. From what I hear, the program, when it was finally released,
has a very poor reputation. I believe it is part of what led to the demise
of Double Click Software.

: Also, how fast/compatible/etc. is it? In effect, is it worthwile toconsider
: I am looking at anywhere from a 131 meg to a 270 meg drive, and wanted to try
: and get it set up right from the very beginning.

No-one has enough hard-drive space, however much they buy, IMHO.

Datalite is a more 'current' program, doing much the same job as DC Data
Diet. I can't remember where it comes from, but it is sold by HiSoft in
the UK. Very reliable from what I am told, and costing I think, around 40
UKP, last time I heard.

Does the SC1224 not have a CVBS input, like the Phillips CM8833 series? If so, then all you need to do is to demodulate the TV RF signal, and send it through there. Most VCR's can do this job for you.

Yup... it's a well known bug. Just click on CANCEL, then try again.
Sometimes it takes 3 tries.
The better alternative is to get a replacement desktop. You'll never
see it again.

I heard somewhere that you could damage your machine if you used "powered
inputs" for the audio in jack. I have not done any digitizing yet because
I am not sure what the term "powered inputs" means- does that mean I can't
plug in my ghetto and record from the tape or CD? At any rate, it sounds
like you might have blown something- but I could be wrong. Perhaps someone
with a little more knowledge here could help us both out.

I am getting ready to purchase a hard drive and wanted to know if anyone had any experience with CDC drives used in conjuction with AdSCSI+.

I have found an excellent deal on a CDC model 94161-155. This is a 5.25" full height SCSI drive. It is 141 Meg and has an average access time of 18.5ms.

I want to make sure before I go and buy it if anyone has had problems with CDC drives as I never see them advertised anymore.

This happened to me as well - at least it sounds like the same
problem. for a day or two, it recorded great, but after that,
everything was all snowy.

The solution was to buy a "ground loop isolator" from radio shack
(look by the antennas). just put this thing in-between your stereo
and Falcon, and all of the sound problems should dissapear...

Good Luck,

> available is non-existant.

Now, what usenet news readers (for the Atari) were you talking about?
...and, that's the way the QWK standard was setup... you are basically asking
for a new standard to be implimented... and currently none of the bbses have
it... and it would take some time.

There is a way to have multiple QWK and REP packets... just create a
separate directories and have multiple copies of your favorite QWK reader.
I know, not the nice way to go about it, eh?

I use an archive Viper 150 with Tapebios for backups. Works very well.
I have seen a German program (Gemmar ??) that seems to be a complete GEM
based
tape backup. I don't know enough German to understand the menus :).

I think the Tapebios & Gnu tar programs were written by the same guy (Alan
Hourihane). The Tapebios program does an image backup of the hard drives,
therefore you can't store or retrieve individual files, but it is fast.

Rob,

Hmmm, maybe we should start a thread about GENEVA, eh? Anyway, to address you comments about the ability to say which is the default desktop, you can already do it. Of course, if the desktop you choose is only single tasking, then you can't use it to launch more than on program... which really isn't a problem when you come to think about it... as most people want the desktop for the disk functions. Simply have your favorite desktop running and use the Geneva Manager's File/Open command, or TaskMan's File/Open command to run other programs... and you shouldn't have a problem using your prefered desktop and still be able to multitask.

Oh, about not wanting to read the manual... luckily Geneva has such a fantastic help system that for 99% of everything you need, you can simply use the Help function. Give it a try... but remember, there is more than one help file so make sure you have the right help loaded for the question you want answered.

The Mega STe has never been sold with a IDE interface, as far as I know.
There CAN be a SCSI adapter inside, if it was sold with a hard drive, but the
SCSI interface is NOT "standard" like on the TTs.

Hi Outside

Better you buy the newest Version 2.06 (or is there are newer one allready?).
It's much faster in working with harddiscs and lots of mistakes are gone but
there're still some in but you can solve them with one or two patch programms.
Anyway the new TOS is not very expensive and there are lots of new and good
helps inside! (e.g. you can lay your programm-icon on the desktop an call from
there; you needn't open all the directories!)

Greetings ...Patrick.

Try ftp.uni-kl.de (131.246.9.95).
It should be located in pub/atari/graphics/gemview or something like
this.Sorry,but getting it from germany is the only solution,i think.

>...
One of the best investments I made for my ST was a tape backup unit. It's
a QIC-150, ie 150MB on standard 1/4" cartridge tapes. I bought it second
hand, so I don't know the new price. Mine was GBP230, including a
(slow) 70MB hard disk.

In terms of software, I use TapeBIOS (free) which provides low-level access
routines, then GNU tar (also free) to do the actual backup. There is also
a image backup, which is much faster than GNU tar, but cannot restore
individual files.

The TapeBIOS documentation states that it drives the ACSI port, not direct
SCSI. Therefore, for a TT, you still need to connect it via the ACSI port.
It will not support a Falcon as-is. It shouldn't be too difficult to
update the driver to allow direct SCSI access, but I haven't done it yet
as I don't have a Falcon yet.

Does anyone have Backward 2.31? I am a Falcon owner (TOS 4.04) and
I've got no 'ST emulator' working with it. There was a post before Xmas
(probably from the author) claiming that Backward 2.31 is finished and
works fine with TOS 4.04. Mail it to me, please. I'm getting desperate
hunting around on FTP sites. Thanks.

After being sent a medium res. version of TW2 as a replacement to faulty
coverdisks I still havn't tried it. I like Timeworks and would buy it if it
supported multiTos and SpeedoGDOS properly, I don't want to spend out on
something that won't work as I upgrade! Does anyone know how this new version
will behave? How much will it cost?

This is a known bug in certain TOS versions; I don't think there's a fix
(other than "use Gemini" or "use NeoDesk" or "use TerraDesk", etc).

> A friend also said he used to get this problem, but hasn't had it lately.

One of those annoying "it comes and it goes" bugs, like the phantom
typist.

> (I wonder if Atari has any plans to release a version of TOS with no
> noticable bugs!? They STILL haven't fixed the RTS/CTS bug AFAIK and
> how they missed the STE desktop.inf reading bug I don't know, does
> Sam Tramiel work as their beta tester!?)

Given the size of their (our?) user base, I suspect the programmers
working on the new TOS are the only beta testers. Actually, given the
Traniel's propensity for *not* giving out *anything*, that seems even
more likely. At least Eric's gotten them to use the developers as
MultiTOS beta testers...

This is the same modem I just got for Christmas, except that mine came from Mac Warehouse (read Mac cable, and a disk I can't even read... :). Its awesome. I love it.

To use it with STalker, you just need to set your baud rate high enough, like 19200, or maybe 38400 if you're using one of the ports that can do that. Also make sure you have hardware flow control on (RTS/CTS), and the proper patch programs installed. (In the EXTRAS folder on your STalker disk.)

If you're going to be using both ST Fax and STalker, make sure that you either don't have them running at the same time, or that one of them is disabled. (STalker has an entry for this under the Options menu, not sure about ST Fax.)

:then, after I select CANCEl, and double-click on it again, it runs
:normally as it should do.

:I've got a 4meg 520STE with TOS 1.6 (UK). [...]

I also get this problem with my 1.62 STE on occasion. It seems to be related
to the length of the filename of the application you are trying to run
(including drive spec. and directories), so by renaming the application with
a shorter or longer name, the problem is fixed.

e.g. I get this bug with D:\LC\BIN\K_RSC.PRG
but not with D:\LC\BIN\KRSC.PRG
or D:\K_RSC.PRG

It's annoying, but easy to fix so I see it rarely nowdays.

Date: 1994-01-10 16:29:49 UTC
From: mcalear@eng.amdahl.com
Message-ID: <4ePl026n5aRO01@JUTS.ccc.amdahl.com>
Source record: 195285

I still have the following software for sale. Highest bid by this
Friday afternoon gets it. Currently, the highest bid is $45.

--Mike

<----------------------- old post ---------------------------------->

I sold my ST a year ago, but I still have a lot of the software. Most of
it is on SS disks. Here are the titles I have:

Flight Simulator II
Mean 18 Ultimate Golf
Barbarian (by Psycnosis)
Gauntlet
Chessmaster 2000
Balance of Power
Gunship
Sentry
ST Karate
The Music Studio
Sub Battle (by Epyx)
Starglider
Championship Wrestling (by Epyx)
Wargame Construction Set
BB System (by Quantum Microsystems Inc.)
Blockbuster
Flash
Defender of the Crown
Hex

I want to get rid of all this in one package. I also have several
"copied" disks (I got everything from a friend) that I will include. If
you have problems with this, just erase everything and get a bunch of blank
disks at no extra cost.

Included in all this is a box full of manuals.

Buyer pays shipping and c.o.d. charges. Email is preferred, but if you
can't get a hold of me, call (408) 992-3181.

Hi,
There are actually several ST specific CDs out on the Market. As a
matter of fact, one came out about a week ago and it is called "Walnut
Creek CD" and it has about 400 megs of ST specific software.
As you mentioned before, you can also use it to read PCD pictures,
programs that support it are: Photo Studio from Eurosoft, GemView v2.4X
and 3.XX, Calamus SL as an import module and other packages from
Kodak/ATARI(joint) to modify photoCD pictures.
And last but not least, you can use your CDROM drive to listen to
excellent quality sound of a CD using Audio CD player programs. The one
that I use (and wrote) is called "Audio CD player for ST/TT" and is upto
version 2.3 now with Full St/TT support as play,stop, pause, track (up,
down, jump,) programmable tracks, and CD player like interface/control panel.
and limited Falcon support (yes, Falcon Support too).

If interested, I will e-mail the lastest version.

Walnut Creek is supposed to release a disk packaged together by some Atari User Group in the US RSN. It was slated to appear "on or about the 27th of December 1993" according to a press release in a recent AEO. I haven't seen anything after that, but it will be a disc containing PD apps & stuff.

Browsing through the German mag ST Computer (or whatever you may call it now that it also incorporates TOS and ST Magazine) the other day I found a vendor selling hard- and software who were advertising for some CD-ROM's. Nothing clear about them beeing Atari specific or not, but I haven't heard the names before in connection with PC disks. Two separate disks with sound samples were offered as well as a 2-disk set entitled Gif Galaxy which should give you a hint about their contents. According to the ad, "PD-collections, sounds, pictures etc" will be available in the future. Getting those German PD collections would be a great move, as the majority of those apps never get onto FTP servers.

> What else are you doing with your CD drives?
> Or, to rephrase it - how much can you get from Mac and PC disks (I
>notice some say for Mac or PC, for example)? And how do you access
>them?

Of course, you can play audio with them. In fact, most people actually play more audio discs than ROMs on them...

As for content, any ISO-9660 disk should be ready to be tapped into. From there it depends on the formats if the material on the disk. Graphics files, sounds and text are perhaps the most useful as many converters exist for the Atari platform. The apps are a bit more difficult, though if you don't have a PC emulator and wish to utilize that. Mac disks are a bit of a problem right now, as the only program I know of which can tap into Mac volumes are MacSee and while they have written code for accessing CD-ROMs, they won't have a product out until they have gotten a C++ compiler up'n' running. Let's hope that won't take long. I myself will be spending a good part of this spring laying final touches to a project on whaling on South Georgia island in the old days which will be a platform independent CD containing text, graphics, sounds, movies etc. The interface to the info will be made for the Mac and possibly for Windows, but the info itself can be used on any platform.

I'll try to get an index together of discs made for other platforms which can be used on the Atari. A steal if you're into DTP/Graphics and own the DA's Vektor application is a disc made by SoftKey containing some 300+ Type 1 PS fonts. I think it retails for about $70 - go check out the latest MacUser or MacWorld (PS: If you want to learn about HW, check out these mags. They are educating and a very good read. Might also be a good source of inspiration for programmers...). It's a two disc set, one for the Mac and one for the PC. The PC one is usable as it is now on the Atari machines.

Hope this helps a bit...

679. ADDING MORE MEMORY TO TT030

Newsgroup: comp.sys.atari.st
Date: 1994-01-10 17:25:31 UTC
From: aa414@FreeNet.Carleton.CA
Message-ID: <CJFCEJ.HpI@freenet.carleton.ca>
Source record: 195328

Hi,
I currently have a TT with 8 megs of RAM, 4ST and 4TT; and I would like
to upgrade to more memory. I was wondering what configurations are available:

i.e., can I get two 4 meg simms and get 8 megs of TT ram and 4 megs of ST
(from before), or do I have to get four 4 meg simms to go upto 16 or get
four 2 meg simms to go upto 8.

Any responce is greatly appreciated.

Would someone with minix.fs installed contact me. I'd like to know if
my program works with longer filenames (it might be of help to you too :-).

Program is similar to select utility which comes with 4DOS on PC (ie.
mostly of use only in connection with a shell). You can select files
easily with cursor keys from a directory listing for commands to be
executed. Supports both shell_p pointer and SHELL env. variable.

- Eero - E-mail: t150315@cc.tut.fi

>The Mega STe has never been sold with a IDE interface, as far as I know.
>There CAN be a SCSI adapter inside, if it was sold with a hard drive, but the
>SCSI interface is NOT "standard" like on the TTs.

Ok, to put it this way, which interface is present for the built in harddisk
on the Mega STe? When I took another look this morning, there were 50 pins,
which should indicate a SCSI drive. Does the interface support > 1 drives,
or do I have to _replace_ the internal harddisk, if I don't connect externally
through the ACSI port? And, if replacing it will work, would it be ok to buy
any standard SCSI drive and it will work? The harddisk currently present is
a Seagate ST157N.

The s stands for system font. The connect fonts should NOT have an s. Just
copy the connect fonts to your fonts folder and add them for each res,
although the font are designed for hi-res.

This is a driver that comes with STraigt FAX and allows you to generate
fax files from GDOS friendly apps.

I recommend you read some info about GDOS. There are some FAQs around.

I have been using DataDiet since it first appeared. I now have version 2.
I have a Mega4Ste, with internal H/dosk, plus an old Megafile 20Meg H/D. It
is Ok on both of them.
I have no problems with it. It saves about 1/3 of my Hard disk space, if
used with DCSqish, which creates compressed programs and accessories,
which are self-decompressing when loaded.
It is now supported by Trace Technologies, who brought out the improved Vn
2.
I believe Pack-Ice gets better decompression, so DataDiet plus Packice gives
good savings.-

: --
: ---> Kendall Gelner (kgelner@nyx.cs.du.edu)
The input to the falcon is a microphone input and is not designed for the higher voltages that line outs produce. No harm can be done by connecting the line outs to the falcon.

The best way to do it is to connect the headphone out of the cd player to the mic inputs and then increase the volume until you hear distortion and then turn back the volume about 20%. This gives the best quality.

I am an Atari Falcon user and have been waiting to see what becomes available as far as digital audio sampling and track recording. I have found pretty good info regarding Cubase Audio and now that Notator Logic will becoming out with a Audio version for the Falcon I would appreciate any comments about N.L. in general, N.L. vs Cubase. Is there a news/usergroup or FTP demo site for N.L.? What is manufacture support like ? I have been an Dr. T's Omega user for years, but it doesn't look like there will be any audio support...

thanks in advance

700. Using Teletext Adapter with TT

Newsgroup: comp.sys.atari.st
Date: 1994-01-11 01:03:17 UTC
From: akisujar@cobra.nus.sg
Message-ID: <2gstsl$m3h@nuscc.nus.sg>
Source record: 195345

Hello from Singapore,

I have been using the British made Microtext teletext adapter with
the Atari Mega4 computer's for several years and very pleased with
it. It connected to the Mega4's printer port and besides reading the
teletext/vidtext pages I can also watching the normal TV program by
connecting video/audio output to another composite color monitor.
(I actually use Sony KX-14CP1 which allowing me to switch between
RGB and Composite Video in the same monitor).

Only problem that I have is when I tried to use it with my Atari TT.
Microtext program no longer recognize the adapter (shown a message "The
Microtext Adapter is not connected"). I wrote to the manufacture only to
find out that they are now only make an Adapter for IBM computer and
there is no newer software for Atari TT. They support is up to Atari
ST/STe and Mega computers.

My questions are:

What is significant differnt between Atari Mega 4 and Atari TT printer
ports?.
I hope that I would be able to patch the existing software to work with
the TT as the bootup software is very short and seem to be a straight
forward program.

Anyone have already managed to get the Microtext adapter working with the
Atari TT?

Any comment would be most appreciated.

Suthipuntha,

School of Architecture, National University of Singapore

701. Falcon Questions & Answers

Newsgroup: comp.sys.atari.st
Date: 1994-01-11 02:46:51 UTC
From: S.P.Taylor@bradford.ac.uk
Message-ID: <1994Jan11.024651.13001@bradford.ac.uk>
Source record: 195347

This is being posted on behalf of somebody with no Internet access. Please post any replies to my mailbox (sptaylor@bradford.ac.uk) and put 'To Dave Haider' in the subject header, and they will be passed on.

----------Included post----------
If you Have a Falcon read this.
First some question and then some answers to questions you might have.

I am a Falcon owner with the following system setup :

4 meg F030
65 meg internal IDE HD + external hard drives
Use AHDI 6.06, drives formatted with HDX
TOS 4.01
Microvitec multiscan monitor (15KHz to 40KHz horizontally)
Previously I used a Philips CM8833 Mk1
other peripherals of no consequence

1. Does anyone have a program that will play sound modules in the background that is compatible with NVDI 2.5 ? I have tried Desktracker STe, Backtrak, Proplay, Natrak and Digiplay.ACC. None of the above work correctly with NVDI, causing bombs or the computer to lock up.

2. When using some MOD trackers I get crackling from the right speaker. For example DIGITAL version 1.02 works fine until it is put on 6 or 8 channel mode when the crackling starts (the crackling can be heard even before a MOD or sample is loaded. It works fine on 4 channel mode. Also Proplay (V.1) crackles when playing MODs in the background (right speaker only). And when AFM (audio fun machine is loaded crackles are also produced by the right speaker. It is definitely not a fault with the speaker and the screws of the internal drive are not too tight as suggested by someone. Also STESOUND.PRG and FPATCH2.PRG do not help. The problem occurs if regardless of the AUTO programs and the ACCs installed.

3. Does anyone have or know where I can get a Speedo Gdos printer driver for my STAR LC10 colour (or JX80 C) printer. It works with the standard epson 9 pin driver but this does not take advantage of the colour capability which I can use in Kadinsky.

4. Finally some of the arrows and writing in some of the buttons in various CPX modules disappear in 16 and 256 colour mode. For example in the Falcon Sound CPX the arrows on the volume bar

disappear allong with the writing on the save, OK and Cancel
buttons. Also arrows and writing on the selectors for the balance
and left and right gain disappear. This occurs regardless of VGA
or RGB monitor, or interlace [double line] on or off. I use
XCONTROL version 1.31 and the following CPXs are the ones to don't
work:

VDI Version 2.10
GEN Version 1.30
FSND Version 2.00
CNFG Version 2.10
WCOL Version 2.10

however the following versions of the SAME CPX modules DO work !

VDI Version 2.00
GEN Version 1.20
SND Version 1.20
CNFG Version 1.00
WCOL Version 2.00
Can anyone tell me why my text is dissappearing ?

Thankyou for taking time to read this note.

Also a hint to any off you using programs that need GEM installed in
RAM, e.g. Winx, ShellBuffer, Outside demo etc. Use ROMSPEED.PRG not
GEMRAM. ROMSPEED does the same thing but is compatible with numerous
programs using the MMU. Also ROMSPEED is compatible with SAM and DESKPIC.
If you can't find the program I will put my copy on some of the FTP sites.

Also If you don't know what monitor is best for your Falcon the answer is
as follows in the form of an explanation.

Ok first I will explain about horizontal and vertical frequencies for all
those who don't know in the way I understand. A monitor display has two
frequencies (frequency means number of times per second) horizontal and
the vertical frequency. The lower the V (vertical) frequency the more the
screen flickers and the higher the V freq. the less it flickers. The H freq.
has no effect on the picture you see. For an example of H freq. your Falcon
on RGB mode (as opposed to VGA mode) produces a signal of about 15KHz
(15000 Hz). So if you want to use the RGB modes (i.e if you want to see true
colour mode in a high resolution with interlace) you need a monitor cabable
of displaying at 15KHz. The VGA modes however require about 37KHz. Most
monitor are set to one horizontal frequency, as follows:

TV / ST COLOUR MONITOR - ABOUT 15KHz
VGA MONITOR - ABOUT 37KHz
SVGA MONITOR - ABOUT 3 DIFFERENT FREQUENCIES FROM 35 TO 38KHz

For Multiscan monitor (which are exactly the same as multisync or autoscan
monitors) there are 2 different types.
1. H freq. range of about 15 to 40 KHz
2. H freq. range of about 30 to >50 (some upto 100)KHz

If you get type 1 you can use both your RGB and VGA modes on you monitor with a slightly modified adaptor. With a type 2 you can only use the VGA modes but if you buy Blow up hard 2 you can get some very high resolutions with very little flicker (but you can with type 2 as well). So I say get a type 1 (like the one I have [a Microvitec 1440]). I have had used all of them and this is DEFINITELY the best buy. The following places stock them in the UK:

Gasteiner
System Solutions
Ladbroke Computing (Preston)

Whatever anyone tells you, there are NO monitors in existance that have a horizontal freq. range from 15 to >40KHz. It is impossible.

In conclusion:
If you want to use you Falcon for typing and comms and music and are not loaded get a plain VGA. It will give you the standard VGA modes.
If you want something more, like larger desktops etc. get a SVGA and BLOW UP Hard 2. (SVGA is useless without Blowup, it is no better than VGA).
If you want massive screens and ultra high rez. get a multiscan type 2.
However if you want massive resolutions AND true colour pics and your interlace modes you most certainly want a multiscan type 1 (like mine).

P.S. System solution say BlowUp Hard 2 is for fixed frequency monitors and for multiscans you should get BlowUp 1. In my opinion (and I have used both Blow Up 1 and 2) you should always go for BlowUp hard 2, It is FAR superior than version 1.

Thats it for now please send me replies or E-mail.
bye Dave.......

I will never get the hang of VI, however I will try to post a message with words. Does anyone know where I can get a program called GIFTOVDO . In the manual to the program Phoenix it says to run GIF animation files that this program needed. Does it really exist. Is it PD or do I need to buy it.

Any help will help

Ericw

Cross-posted to: comp.sys.atari.st,

The Zyxel works fine on ST's.

Connect and Coma both support the fax and voice-mail options of the modem,
and most (if not all) fax packages will communicate with it with a
minimum of fuss!

I know 2 people using them, and they've never complained about them!

Here's some info for this almost-illegally addictive game that me
and a friend have picked up after about 40 hours of game-play....

Hopefully this will send without crashing.....

Autopilot:

When selecting a target, always zoom in as far as you can before selecting
it. Click once on it, then double-click on Zoom, then select 'F10 -
Select destination', and return to the main view. Then, engage the
autopilot, and select maximum star-dreamer time. When you get to the
planet/dock, select max' star-dreamer time again, and you will appear
in the landing area. NEVER use anything other than Minimum (Normal)
or Maximum Star-Dreamer time for this operation, as you almost always
crash INTO the port! Using this procedure has worked every time, and
gets you where you're going VERY fast!

Do not use the identify objects item (F10 - Identification Text Icons),
the text produced seems to really confuse the autopilot, as it appears
to think it is an object, and usually crashes you into the port/planet.

Starting the game:

Follow the instructions until you get to Barnards star. Then, buy as
much farm equipment as you can, refuel, and go to Sol. Sell the farm
equipment,and go into the Shipyard and remove everything from your ship
except the Autopilot (NEVER leave home without it!), and the Hyper-Drive.
You need this money, and the cargo space. And, trading between Sol
and Barnards Star never requires the use of weaponry or Atmospheric
Shielding. (Weaponry may be needed if you help mafia enemies etc.).
Now, trade Animal meat with Barnards star, and as soon as you have
the case, buy Robots or Computers from barnards star, and sell them
at Sol. Before you sell Robots or Computers always check the bulletin
board first, as there is almost always someone willing to pay twice the
Normal price.

Eventually, you can just take Luxury Goods to Barnards Star, and Computers
or Robots to Sol (Robots have a higher profit margin), and build up
your cash. Buy a larger ship ASAP capable of at least 6 light-years
travel with the drive that comes with it, and fit an auto-pilot to it.
The larger the ship, the more you can carry, and the faster you make
money.

Basically, don't bother with any missile other than Naval missiles, they
are the only ones that ever seem to hit, and even then they usually
have to be launched when the enemy is within about 3Km of your ship. He
will then run away, you can lock your autopilot onto him, and when he

eventually returns and gets within 5Km, hold down fire and as long as they haven't got tougher shielding and lasers than you, they will almost certainly blow up!

Yay, it worked, (I did it in capture due to the first time it crashing about 5sec's before I saved it 8-(

Happy trading!

Yup... it's a well known bug. Just click on CANCEL, then try again.
Sometimes it takes 3 tries.
The better alternative is to get a replacement desktop. You'll never
see it again.

------> End of Quote from Craig Shore.

Which is why I've got Kaosdesk! :) (Not the best, but it's very small,
and nice and quick. I've also bought Neo-Desk, but won't be able to
use it for a couple of months until I can buy myself a Hard-drive! :)

Tera-Desk is of course a lot better than KaosDesk, Gemini I haven't
had a look at yet, I've had enough of trying to understand these
far-too-good German programs :) (Do they have better schooling over
there or something!?)

He is obviously an NVDI user - the 's' means that the font is used as a
replacement for the system font.

As far as I know, there is only one font per file in the CoNnect fonts,
but they are offered at normal and 2x as usual...

711. Atari 8-bit/ST emulation for the PC (MSDOS or UNIX) ?

Newsgroup: comp.sys.atari.st
Date: 1994-01-11 06:34:55 UTC
From: natasha@zwicky.unm.edu
Message-ID: <2gthafINNgv3@lynx.unm.edu>
Source record: 195257

I currently have an AMD 486DX/40 with MSDOS 6.0 and Linux OS's.
And from my more memorable computing days an Atari 1050 disk drive with
lots of old programs. All of which are unusable since I traded in my
130XE a couple of years ago...

I have recently heard that there is an atari 8bit emulator that can load
programs off the 1050 drive through the joystick port, for MSDOS.

Does anybody know where this can be found and/or purchased?
How about where a cable that would adapt an atari serial into
the joystick port could be found or how it could be made?

Perhaps there is an ST emulator for the PC that also emulates the 8-bit???

I remember hearing a couple of years ago that someone was writing an
atari emulator for Unix on the net; has anybody heard anything about this
lately?

I appreciate any comments and help! I have so far run into several dead-ends..

Thanks,
Marc Bluefire

I've been looking long and hard for a *good* .MOD editor/player with which I can "play out" some of my musical inspiration. So far, I've been using a program called Noisetracker, but the version is very, very old, and the program has bugs up the wazoo.

I've asked around for the best editor/player there is, and the response I got was Protracker 2.1. Unfortunately, I don't have FTP access, and I haven't been able to find it on any of the local systems. I'd like to get the STE version so as to make full use of my 1040STe's capabilities.

Does ANYONE out there have Protracker 2.1 (or a newer version?) that they could UUencode to me via email? Uh, please? :)

(Oh, and please DO respond to this account though email, as I never seem to find the time to make it through all of the posts in this newsgroup!)

Thanks!

Yup... it's a well known bug. Just click on CANCEL, then try again.
Sometimes it takes 3 tries.

It can often be fixed by renaming the program. Back when I had an STE,
I used to get this with STZIP.PRG Renaming to ST_ZIP.PRG solved the problem
permenantly for that program.

It's a known STe bug. ISTR a rumour that it only happened on 8char filenames
but I'm sure I've seen it on all sorts of file names.

In the UK it was sold/marketed by Atari.

> distributed through Atari.

I would hope that it would be ok to do so on a personal basis. I've been wanting to have more recent versions of MiNT myself _BUT_ since I'm not up-to-speed using GCC (I just downloaded it the other day and haven't found all of the utilities I need for it yet!)... and considering all of the files and disks worth of stuff it takes for a new user to get the project off of the ground... it is almost impossible... or A GREAT TASK TO UNDERTAKE. If you look at the docs in the MiNT v1.08 sources, it also states that one shouldn't use it unless one has the expertise (sp?) to debug problems that might arise... and fix them. Who do you know that can do that? I would think that there are only a handful of people with such Atari/MiNT/GCC/C expertise in the US... and not that many more around the globe. That's asking quite a bit if you ask me.

It sounds as if the person who posted the plea has actually made an attempt to compile MiNT v1.08 source... I know I have, but we'll be stuck until we figure it out... unless someone can mail us the bins.

I'm !_NOT_! advocating that someone post publicly, for mass consumption... the bins... but it would be nice if they were available on a - I tried days worth of effort but couldn't figure it out - request.

Hello All,

Gee whiz, I'm starting to feel stupider all of the time. *grin*

I recently searched for the latest MiNT sources and GCC. After downloading for hours it turns out that I need more utilities to compile MiNT, I need to abandon what I've already downloaded (so far as GCC is concerned) because it isn't the latest version... because something was changed in an include file somewhere downstream... more and more hours of downloading IF I can find everything... I'm not even sure what all I need.

Sorry to whine in public... BUT...

Can someone enlighten me with an easier way? What do I need, where can I find it (especially documentation), etc? I'm not looking for anyone to teach me C programming... I just want help in locating the GCC and G++ development systems as well as some help installing and operating the various utilities... with the general direction of compiling MiNT.

It's exactly the same as the current one, just it runs on Falcons and works with
Speedo fonts. The font handling is the same as old GDOS. Basically, the program
is exactly the same but now 'works'.

726. More Falcon monitor questions

Newsgroup: comp.sys.atari.st
Date: 1994-01-11 10:57:38 UTC
From: pd@mbuc.bio.cam.ac.uk
Message-ID: <1994Jan11.105738.24185@infodev.cam.ac.uk>
Source record: 195272

Can anyone tell me an exact make of monitor which I can use on my Falcon
maybe with blowup or screenblaster, that will allow _all_ programs to run.

ie programs which need either RGB, VGA or some other type.

I can't really afford two monitors and I haven't got the space anyway.
I'm sure there must be a monitor like this out there somewhere.
My best guess is a multisync/multiscan but I'm not sure.

Price and availability in England would be handy as well.

Thanks,
Phil (I want a uk jag _now_ not March!!!)
(e-mail pd@mbuc.bio.cam.ac.uk)

I believe that Zyxel is sometimes too fast to be supported by the ST's
serial ports. In compressing mode, the baud rate can be as high as 57600 (or
something), which, to my knowledge, is far too much for our good, old STs.
Perhaps it is necessary to restrict Zyxel's speed to 19200 Baud (ST to modem
and vive versa).

I believe that the CPU in a lynx is an 8-bit 65c02. The reason parts of it are described as 16-bit is that the custom chips are 16-bit. So, the CPU is only 8-bit while the rest is 16-bit. Usually this distinction is made clear (e.g. see the lynx FAQ from the atari video games newsgroup).

Lloyd.

P.S: It could be just the graphics engine that is 16-bit (I can't remember right now).

If you want to run everything you'll need both an RGB and a VGA type (pref multisync). I use a Taxan with Blowup030 and get 960x680x16 with a good refresh rate and have taken it much higher (1400x800x2) but couldn't read it anymore as the monitor is only rated to

|> Price and availability in England would be handy as well.
I got mine (normally 500+VAT GBP) from bubbles@cix.compulink.co.uk for 250 GBP slightly used. I'm very pleased with it. Just mail him and ask for details on Multisyncs for a Falcon. He buys & sells PC/Amiga/Atari stuff and will be able to help you

>and vive versa).

For luck - this is no longer true. Using the new HSMODA01 serial drivers
on a 8MHz ST with a telecoms package supporting HSMODA you can get transfer
rates up to 7000 and mode cps (you have to make slight hardware modifications
to your serial hardware - info: stephan_skrodzki@ka.maus.de or
harun_scheutzow@b.maus.de).

In case you put an extra SCC chip into your ST (for info write to
harun_scheutzow@b.maus.de) you will have transfer rates of 9000 or 10000 cps.
Both - the new CoNnect 2.4x and GEMRZSZ support this new driver.

(Just to mention: This rates can only be obtained using null-modem connections
between to computers as normal modems can't cope with this speed, yet)

Wolfgang

Hmm... I've been thinking of trying to compile MiNT also, but been waiting for a slow MONTH at work to get all the files. Maybe someone has/could start a FAQ for this? Or is there a site with all the necessary files you can just grab out of a directory? Jumping from ftp site to ftp site can be a real pain, especially since overseas sites can sometimes be dog slow.

******** Stuff deleted about the difficulty in compiling Mint 1.08 ******

I feel the same way about GCC, I don't know what I need to D/L to
compile Mint. I am not willing to go through all the Mint/GCC documentation
available because it would take so long to sift through it to find what I
need.

Ok, If we can't have binaries, how about somebody who has compiled mint
1.08
posting a short " How to ..." guide. Intending users can then decide if
it's within their capabilities.

The NeoDesk 3.04 patch is only available as part of the Geneva package.
Version 3.04 of NeoDesk is only necessary for better compatibility with Geneva,
and is not going to be available as a public release at any time. The next
full release of NeoDesk will be NeoDesk 4.

Hmm, I got one from there as well. Just curious - where did you hear about the modem? (I heard about it on an ST BBS from an Amiga user who saw an ad for Mac Warehouse in an Amiga magazine). At least the cable was separate from the modem (since the modem has the normal 25-pin RS232 port).

Well, I can read the disk they sent (and the free Weather forecaster package), but then again, that's under Spectre GCR ;-)

>To use it with STalker, you just need to set your baud rate high enough, like
>19200, or maybe 38400 if you're using one of the ports that can do that. Also
>make sure you have hardware flow control on (RTS/CTS), and the proper patch

Might also check the error-correction and compression settings (MNP...vbis...) and see what the best settings are for your situation (i.e. compression may not be useful if you're downloading GIF, LZH, ZIP, etc files). Also, for CoNnect to work properly, I normally do a "AT&C1" so that the modem handles the carrier detect properly (otherwise, when you use the dialer, CoNnect complains that you're already connected, which is what the modem sort of tells you by default)...

There also exists a text file with all the ATS settings (and choices) available on GEnie (I'll post it to atari.archive if someone already hasn't). This is helpful as they didn't list the settings in the manual (a really dumb move, I think)...

You're not kidding. It's distributed in the UK byt GST Software - I can't
remember the address off hand, unfortunately. I think it's also on a BBS
somewhere, but when I tried to download it, users were limited to 300k
of download per day, and the upgrade was about 310k. Very clever...
I left e-mail for the sysop but didn't receive a reply.

Secondly, the problem is the the UK upgrade is different to the US
upgrade. If anyone has a copy of it, could they upload it to the
atari.archive or something? Failing that, mail it to me and I'll
do it.

What did you have in mind? NetHack, Omega, Angband, Moria, Rogue, etc
are all ported (though the Angband port is pretty unstable... I'm
porting a new version right now). There are tonnes of commercial
fantasy RPGs (Dungeon Master, several Ultimas, Amberstar, Ishar and
Ishar II, etc), and more than a few "wargames" (for example, Paladin).

6.2.2 apparently... When I installed it, the boot message still says
6.2.0 or something. And this is straight off of GEnie! No wonder
they've still got that bug that requires the evil kluging in the
minixfs...

I have heard of "cracked" versions that don't check for ICD hardware;
seems like a stupid idea to me... would _you_ assume someone else's
hardware drivers would work 100% perfectly on somebody else's hardware?!?

> I guess they're afraid someone will put some fake software up and
> when it crashes and burns, ICD'll get the blame. Still, anyone getting

All they've gotta do is put a disclaimer in there with the files, "Use
at your own risk. For a less risky version, call our BBS or GEnie."

Gee, it never fails to amaze me about the price differences in the same products across the pond. Doesn't seem to be any rhyme nor reason to it.

In the U.S., a 340Mb Quantum SCSI 2.5" drive costs $659 while an external 340Mb Quantum 3.5" is $299 internal and $359 external (prices quoted from LaCie's latest ads... they are a Quantum company). Anyway, 2.5" SCSI drives are *definitely* more expensive than 3.5" SCSI drives, at least over here.

Bob,

Do we have to send in any of the 3.0x disks when we upgrade to 4.0? I found
no mention of this in the newsletter if it is so. Also, if we upgrade, will
we be getting a new manual (i.e. one complete manual)? It's very difficult
now to have to look for things either in the 2.0 manual, 3.01 manual or 3.03
documentation. If I have to add another manual to this list, I'll go batty!
Even if we are just doing an upgrade, can we order a comprehensive 4.0 manual
that has *evertything* in it?

748. CIVILIZATION bug - solution possible?

Newsgroup: comp.sys.atari.st
Date: 1994-01-11 15:54:02 UTC
From: minidis@urz.unibas.ch
Message-ID: <1994Jan11.155402.43443@urz.unibas.ch>
Source record: 195289

Hi there,

I have the following problem with CIV:

as soon as a become too good (e.g. most of the world-wonders, huge towns, etc) and i want to retire (or when the game has ended after conquering the entire planet) the game crashes with 4 bombs when displaying the charts of the different civilizations. the graph of my culture suddenly goes into a negative number (therefore probably the crash). no entry into the hall of fame after that.

anyone out there who knows a solution (e.g. a patch or whatever) to this problem?

please *EMAIL* any responses, I will compile them, thanks.

I have a Falcon030. I don't have remotely that many things in my AUTO folder;
I don't know what a lot of them do; some of the others I didn't think did
```

anything on the Falcon. I'd like to get my setup right.

So I'll presume the above list is a good starting point. Let's (please) have
a discussion of what each item does, whether it's needed, whether something
else does an equivalent job, and whether anything else ought to be added. Ok?

Let's start:
ROMSPEED copies the TOS ROMS to RAM, no? Speeds things up.
FOLDR40 (is that right? I thought it had to be FOLDRxxx) fixes OSPool handling,
But I thought that wasn't necessary on the Falcon030.
NVDI and NVDIFIX replace the painfully slow VDI, for a big win.
SILKMOUS is a mouse accelerator, I think. It helps a lot to have one.
SAM is System Audio Manager...I don't know hat it does, but there's a manual.

Other people care to continue this?

Steve

To users of comp.sys.atari.st, comp.sys.atari.st.tech and comp.sys.atari.8bit:

Might I suggest that some of you consider putting your .sig files on a diet???

Some .signatures are extending to 15 lines or more which is quite excessive, considering when standard netiquette rules call for signatures of no more than _5_ lines. We all appreciate your artistic talent but only the FIRST time we have to scroll through your monster .sig!

Please keep in mind that some people PAY for their access to the nets and an excessively large .sig is just wasting their money as well as bandwidth.

Please be considerate of others, and thin down those bulging sig's, OK?

Many thanks!

AA> far, I've been using a program called Noisetracker, but the version
AA> is very, very old, and the program has bugs up the wazoo.

I'd suggest picking up a program called Octalyser STE. It allows
8, 6, or 4 channel MODs to be made. It's a wonderful program and though
it chokes on a few of the IBM MOD-types, it works fine with almost all
Amiga and St mods. If it does come across a MOD that won't read right,
it tells you there's an error and gives you the option of exiting to
desktop. It is also the only MOD player that I have found that actually
uses the FineTune option. One MOD I have called Gunslinger, works
perfectly on Octalyser, but sounds TERRIBLE on NoiseTracker or
Digi-comp.

It has many functions such as allowing 4 different sample rates, sample
editing (this function is disabled in the unregistered version), and
IMHO, is the BEST MOD player to be found.

It's called Octalyser STE, and was written by Christian Dahl.

I don't know if you can find it on any of the FTP sites, I found it on a
local BBS.

I've just registered (and received) 'Antidote'. The share-ware version
of which is available in the Disk-Magazine 'Scriba-Communis-Responsi'
(The last version was I think Issue 2 Volume 2). The registered
version runs as an ACC, and multitasks under pretty much everything,
the next version should be able to remove viruses from memory as well
as from disk. It's quite a good little program. (The letter I got
from Kai Holst, the author, said that I was the first, and only person
to Register, and I'm halfway across the world from him!)

SCR is available at:/

atari.archive.umich.edu

in the

atari/Magazines/Diskmags/Scriba/

directory. Filename is something like scriba22.zip

It's only about $10US to register, and has heaps of good features!

There is also the quite out-of-date V-Killer v3.84. This handles the
more common viruses, but is about 3 or 4 years old. It is usually
sufficient, but doesn't handle link-viruses and doesn't calculate
virus probability.....

And in return for my "public service" message I received the following in email
from an obviously disgruntled poster to this newsgroup:

>And may I remark that standard netiquette also says that such kind of comments
>on other peoples posting should be done by private mail?

C'mon now, folks. Did I name names? If this individual or anyone else wishes to
continue the practice of huge .signatures, that's their decision. I was simply
reiterating what the net policy was and _why_ it existed because it ocurred to
me that some people might not know about this "rule."

My apologies to any whom I have unintentionally offended but I also submit:

"If the shoe fits, wear it." :)

Hermes, Okami. (There's more, but I don't remember their names)

> ...and, that's the way the QWK standard was setup... you are basically asking
> for a new standard to be implimented... and currently none of the bbses have
> it... and it would take some time.

No i'm not! I'm talking about the way the messages are unpacked at my
end. There's nothing stopping my computer storing the messages from
the incoming packets into some sort of a message system so they're
always there, and just adding on the new packets to what's already there.
You could use the same sort of expirey system as the usenet readers do,
user configerable to delete read messages, older than n days, more than
n messages in a subboard etc etc.
I'd also like it to mix all bbs's into the one system, instead of keeping
each bbs's packets seperate.

> There is a way to have multiple QWK and REP packets... just create a
> separate directories and have multiple copies of your favorite QWK reader.
> I know, not the nice way to go about it, eh?

Definetly not! :-)

>
> Any help will help
>
> Ericw

Hi Eric!

GIFtoVDO is a utility that comes with EVERY package of Phoenix available.
Now it is essentially freeware and "old" ware too as our builders and
players have been upgraded to GIFtoFLM, TGAtoFLX and GIFtoFLI/C.

If you do not have GIFtoVDO then I would like to know where you purchased
your product as every Phoenix in existance was shipped with it. You should
also have gotten Cybersculpt with it.

The Lexicor FTP Site is world.std.com there you can find some updated
stuff that is free. The new builders for FL/C/X are not free..only the
players....if you already own Phoenix then you are entitled to get the
builders, however you should send in your registration card.

If you have any more questions please feel free to ask me, or email me.

765. Quick ST 2.2 and VDI v_curtext call

Newsgroup: comp.sys.atari.st
Date: 1994-01-12 01:26:51 UTC
From: gregk@nskernel.tandem.com
Message-ID: <CJHtCs.5Jy@tandem.com>
Source record: 195211
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have had Quick ST II and Laser C for a few years now. Some time ago I developed a program which uses the VDI v_curtext routine to display text on the screen. This worked fine until I upgraded from TOS 1.02 to 1.04 (or 1.2 to 1.4).

After the upgrade, only the first character is displayed when the text string contains multiple characters.

It works if I disable Quick ST 2.2.

Has anyone encountered this problem? Any ideas on what is going wrong?

Source record: 195213

Well, this file is the most dodgy piece of Shareware software I've ever seen.

It's a VERY obvious rip-off of 'Gods' by the Bitmap Brothers/Renegade, the sprites are virtually identical, usually just smaller, the welcoming picture is virtually identical (Same picture, poorer quality), and these people want money for it. If it was smoother, the graphics improved slightly (but not much), and the sprites enlarged, it would basically be Gods. The lives and energy remaining icons are exactly the same.

Should this be allowed? In my mind, this game is a pretty obvious form of plagiarism which people have spent time 'inside' for.

Now, back to your regulary scheduled GNU speke.

>slow.

Well, this isn't really an FAQ, but here are a few comments from my
experience compiling the lastest MINT on my Falcon.

1) Stuff You Need:

Everything you need to compile MiNT can be found on
atari.archive.umich.edu (really msdos.archive.umich.edu if you
actually want a chance at connecting).

The software you need is:

Zoo, used to extract the rest of the files - found in /atari/Archivers

Make, found in /atari/Mint/Utilities/bmake???.zoo. Put it into your $PATH

GCC, found in /atari/Mint/Gcc (just get the bgcc???.zoo, and gccutil??.zoo
files) uncompress them all into your $PATH)

The Mint libraries, found in /atari/Mint/Lib. Called something like
mntlib93.zoo, and mntinc93.zoo - extract these respective files into
your library and include directories (don't forget to make sure your
GCC env vars are set correctly!)

Patch, to update Mint from 1.8 to 1.89. Found as
/atari/Mint/Utilities/patch.zoo. Extract this into a directory somewhere
in your $PATH too.

Bison, for reasons too arcane to detail here - found in
/atari/Mint/Utilities/bison???.zoo. Put this into your $PATH

The Mint source itself - found in /atari/Mint, called mint108s.zoo and
diff1819.zoo.

2) Steps you need to take to get the compilation to work:

When you extract the diff1819.zoo file, you should get to files called
diff1819.txt and diff1819.spp - you need to run patch on both of these
files to update the Mint source. Make sure these files are in the
same directory as the mint source, and run:
"bpatch < diff1819.txt"
"bpatch < diff1819.spp"

these should give you fairly friendly messages, if not then there is a
problem. I used bpatch instead of patch (they both come in
patch.zoo), because bpatch worked.

I also had to alter the makefile slightly:
* commented out YACC variables in makefile (is there a real YACC for
the ST?), uncommented the YACC=bison lines.

* added -mint and -DONLY030 flags into default compiler flags. I'm
pretty sure that at least the -mint flag is a really good idea.

3) Actually Compiling

Strip your system down to as few extras as possible. On my 4MB
Falcon, that meant no desk accessories, no screen accelerator, only
the most nessicary auto patch programs and Screenblaster. Then, set
$SHELL to "sh" (which you do have, right?), and forgo your memory
hogging BASH shell to a slimer sh by way of "exec sh" (note that $PATH
transfers to new shell also, saving time over running sh from the
start).

Great, now you are ready to compile. Make sure all of the programs
you had to get are in your $PATH, and just type make -f makefile in
the directory with the Mint files (thoretically you should only have
to type "make", but that does not yet work on my system...)

It should spend a long time compiling. Somewhere during the middle,
it may complain that it could not "mv y_tab.c and y_tab.h". If so,
move y.tab.c and y.tab.h to whatever it wanted to rename the other
files to, then type make -f makefile again. It should then finish
compiling ther rest of the way, and abort when it cannot run "prgflags
mint.ttp 7 7". Ignore this, run xstrip on mint.ttp, and you are
done. Move mint.ttp into your auto folder (you did save the old one,
right?) and rebot to enjoy your new Mint.

Note that this is a very skelital version of what you need to do to
compile Mint, and actually asssumes you know quite a few things, have a
lot of file utilities already installed, and are somewhat familiar
with GCC and the setup thereof. I may have forgotten a program or two
above that you need - if so I apologize. This also represents my

experience compiling Mint on my Falcon - I make no garantees that
these steps will work for any other machine, much less another Falcon,
or perhaps even my own Falcon twice in a row. :-)

Good Luck All,

According to my experience in compiling MacMiNT, you'll need:

from ~ftp/atari/Mint/Gcc of atari.archive.umich.edu,
bgas138p4.zoo
mgutil36.zoo
bmake363.zoo
mgcc253b.zoo

from ~ftp/atari/Mint/Lib,
mntinc39.zoo
mntolb39.zoo

(Because I'm not using atari, it may not be true...)

Greg Kilfoyle did willfully write on 12 Jan 94 (to All), and I quote...
GK> From: gregk@nskernel.tandem.com (Greg Kilfoyle)
GK> [re: problems Quick ST II and TOS 1.2 -> 1.4]
GK> [...]
GK> It works if I disable Quick ST 2.2.

Quick ST II was replaced by Quick ST III in 1991, largely to provide a 68030 (TT) version, but I would imagine also addressed a number of compatibility aspects that had surfaced with later TOS versions.

Subsequently, Darek sold Quick ST sources to Codehead and QST 3.5 effectively became Warp9 v3.5. Current version is 3.80.

I'd suggest you either found a later version of QST (3.x) from someone who has this and has upgraded, or get Warp9.

This guy is French (cocorico !) and unfortunately he doesn't have any access
to the net... I think he gives the new versions to a friend of him who has
access.

Try to contact ST Magazine, too, they know him.

If you post an article on fr.comp.sys.atari you should get answers.

There is a really good (scientific) one called HP-Like, that is really nice
to use as soon as you like RPN calculators.

There are various CPX calculators available a A.A.U.E, too.

From: marcel@eba.eb.ele.tue.nl
Message-ID: <2h0iot$6he@tuegate.tue.nl>
Source record: 195225

Hello,

I am writing (or trying to) write a GEM application on my 1040 ST,
but i have encountered this annoying little problem which has me stymied.
This is what happens: Everytime i send more than, say, 5 or 6 messages to
some application (mostly mine), counting succesive REDRAW messages as 1
(because the AES packs these together automatically), without issuing an
EVENT_MULTI or the like, my ST hangs.

As said, i work on an atari 1040ST, TOS1.4, 3Meg internal memory. Can any-
one help me here? Reply per Email or as answer to this posting. My address
is marcel@eba.eb.tue.nl.

Thanks in advance,

--- Marcel

Stacker on MS-DOS works fine if you have a fast machine where
compression speed is higher than HD transmission rate. Forget it with
8MHz Atari computers.

There are no PD screen accelaerators, as far as I know. Try NVDI or KAOS-
TOS, which are worth while purchasing them.

Hi netters!

I'm desparately searching for a newer version of uw, the fabulous multi-window terminal program. The only one I have, is from a.a and it turned out to be a beta version.

Is there someone out there, who knows whether a newer version exists?

Does anyone know the email address of Brian Katzung or Brad Bosch, the authors?

Thanx in advance.

Regards,

Andreas.

Hisoft in the UK sell datalite which does on the fly compression with
different partitions settable to different levels of compression and
compression on/off. It's fast-ish but the high compression rates really need a
fast ST or a TT. Also a lot of people have reported corruption so reliability
is a possible problem.

Well, I run a very old version of stacker on an 8MHz 8088. It's an Atari
PC3 with a 30 MB harddisk. 10 MB is uncompressed, for programs which use
large swapfiles, and the other 20MB is divided into two stacker partitions,
10MB each. It works fine. And the speed degradation is not that big. (20%
I guess.) I believe an 68000 on 8MHz can do a lot more than an 8088 in the
same time.

Some of you older folk will remember the Scott Adams series of adventure games from the TRS80/Apple II days. I know Scott Adams folded a long time ago. What happened to the games? Did they become PD? I only ask because I have seen them around for the PC touted as PD via a 3rd party interpreter much like the Zork interpreters you can get to run PC Infocom games on the ST.

The question. Is there an equivelent for Scott Adams games ie is there any way I can run them in any shape or form on an ST or better yet a Falcon?

I have the following items that I need to sell:

CASIO FZ-20m rack-mount sampler. 16 bit. Analog filters.
SCSI interface. 8 outputs. Built in graphical editing.
Huge library. $1000

CASIO MG-510 MIDI guitar with case. Excellent condition. $400

E-mu Proformance-1+ piano/organ/bass/vibes module with
enhanced fidelity output modification. $300

Fostex 460 multitrack cassette with 8ch mixer.
Mixer features parameteric EQ, mic preamp w/phantom power
on each channel. List price was $2795, sell for $900

Fostex 2016 16ch or dual 8ch mixer. Rack mount (2 spaces). $300

Niche ACM 8ch automation package. Non VCA digital level control.
runs from any sequencer or hardware MIDI fader device. MINT! $400

Ovation Preacher solid body electric guitar. Mahogany/Gold. $400

Power Amp. Dual mono construction. Channels matched component
by component to within 0.1% tolerance. Ideal for studio monitoring
130 w/ch. $400

EMG 81's. Humbucking guitar pickups. 1 pair w/controls. $100

Boss DIMENSION C - beautiful smooth 'space chorus'. $100

All prices are somewhat negotiable.
Please leave mail or call (612) 872-6698 (voice).
Thanks for reading!

794. Some Calamus questions

Newsgroup: comp.sys.atari.st
Date: 1994-01-12 14:39:54 UTC
From: martinmf@imv.aau.dk
Message-ID: <martinmf-120194153059@njord.imv.aau.dk>
Source record: 195249

Dataformer module: We are working with SL on an Atari, and want to export EPS-files to a Mac. If exporting through the Dataformer module (which we haven't bought yet), will it then afterwards be possible to change the colour of a single object, for instance a letter, on the Mac?

The case is: We are producing book covers, and want to use Calamus for the typesetting (because of greater accuracy), but the end production has to be delivered from a Mac (not our choice).

By the way: Anyone out there with experience of the NT Calamus? It is not yet available in Denmark.

Thanks for any replies... :-) Martin

I have seen Data Diet (From DoubleClick) at work (I -don't- know if Data Light is it's succesor or predeseccor) on a 1040ST, and it seemed to work quite well, although (altough?) the compression wasn't really 'on the fly': everytime a file was written or updated, some logfile was created and on exit of some application those files were compressed. Besides that, programs like Kobold are known to 'bypass' DataDiet, which leads to compressed files on floppy disks. So if you're carefull enough, it's possible but I agree with a previous posting: a larger HD is the better alternative.

Greetings,

>EVENT_MULTI or the like, my ST hangs.

>As said, i work on an atari 1040ST, TOS1.4, 3Meg internal memory.

From my limited experience with AES programming, I'm not sure
that the AES packs redraw messages together. I always thought
that the AES passed messages sent by one app to another without
interfering with them.
Anyway, I do know that the AES can indeed be jammed when too many
messages are pending in its internal queue. This may lead to
bombs or to the system hanging, depending on the TOS version and
other circumstances.
I suggest that you call your redraw routines directly instead of
calling them by sending a redraw event to yourself over the AES,
and see if that fixes the problems. If you're concerned about
inefficient or superfluous redraw messages, don't rely on the AES
anyway, use your own techniques instead. For instance, when a
redraw event arrives, you might poll for additional redraw events
with evnt_multi(), and merge the events if appropriate before
actually processing them.

If they don't _all_ work in any res, the person who programmed 'em is a
bozo. GEM apps should be res-independant.

Check out ProCalc (should be on atari.archive)... I use it in any res
(it's a pity I'm limited to ST resolutions), though it is rather large.

He's not asking for a new standard, just a smarter QWK reader. There's
absolutely no reason (other than programmer laziness) to limit a reader
to one QWK packet... the _reader_ should take care of keeping everything
separate, etc, not the _user_. That's what computers are for.

People with .sigs longer than four lines should be shot... (HINT GUYS)

>Unless the MSTe is unique is should be using SCSI drives, not IDE.
>On my TT I have a 25 pin SCSI connector. Doesn't the MSTe have this also?

Correct, the MSTe uses SCSI. This is probably a FAQ - the hostadapter
in the STe can only handle _one_ drive, so there is no point in trying
to cable another on. Either replace the hostadapter, get another
one to go externally, or get a bigger drive and toss the old one.

(Hard & Soft do a replacement internal controller)

No, the MSTe does not have an external SCSI connector.

AES really does this, but only with messages immediately succeeding
one another. See for instance 'Das Atari Profibuch' on the AES. Or else
there is a nice way to check (takes some programming!):

create yourself a desktop with a lot of icons on it. Install this desktop,
so you'll get the redraw-messages for this desktop yourself. Now send for
every icon on the desktop a redraw message concerning the rectangle surrounding
the icon. You'll see that if you place an event_multi after every redraw-
message you send, every icon will be redrawed independently (or at least
you'll get the messages to do so yourself). If you omit those event_multi's
and just add one after all send_redraws (still following me?) you'll see
a redraw for the complete box surrounding all icons. (This was the way
I discovered the phenomenon. I got a redraw message for a window inside
such a surrounding box altough I only sent redraws for icons not over-
lapping the window!)

But of course, thanks for the advise!

AESes before MultiTOS merge redraw messages---since MultiTOS can store
many more messages (unbounded?), they dropped the merge routines, because,
if I remember right, merging two rectangles will introduce areas that
didn't really need to be redrawn and would hence be bad for efficiency.
I can imagine applications which would be less efficient this way...

Has anyone heard of any software or hardware adaptor that would allow a Falcon to export images to video? Ideally it would be able to record frame by frame to a normal VCR. Any information would be greatly appreciated.

Also, does anyone know where I can get a copy of Backwards so I can run my software again?

Finally, to all US Atari owners... are any of you able to subscribe to actual Atari magazines? I don't know of any. If any of you actually get Atari magazines, could you please email me subscription information? Thanks a lot!

Ya know, surprising as it may seem, it seems to be difficult to stay aware of things in the Atari community. :)

Is there something wrong with the old one? I've been using it for
years between my Atari (ST, then mega, now TT) and my Sun at work (varying
from a Sun4 up to a sparc10 now (very nice!)) with almost no problems
whatsoever. Since you can compile your own copy of the client (server?)
side on the unix box with the code provided, the distribution is
pretty stand-alone as is... What problems were you having??

>any standard SCSI drive and it will work? The harddisk currently present is
>a Seagate ST157N.
The Mega STe contains an internal ACSI to SCSI adaptor. This is a small board that plugs into the main motherboard, and can be found in the rear right hand corner of the box (behind the hard disk). This board contains a DIP switch which may be used to set the ACSI ID of the drive (which is independant of the SCSI ID set on the drive itself). For this reason, it is very unlikely that you could connect a second drive to this interface (although I cannot verify this at the moment, as I don't have my ST here). In any case, the internal power supply is unlikely to be able to cope with a second drive.

If you decide to replace your internal hard drive, any standard 1" high SCSI drive should do. I am using a Quantum LPS52S, which works with both Atari's AHDI driver, and with the ICD driver. The only thing that might be a problem is that some recent SCSI drives (such as the Quantum ELS series) do not have a jumper to enable/disable parity (I believe parity is permanently disabled in the ELS series, but don't take my word for it!). I cannot remember whether the AHDI and ICD drivers require parity to be enabled or disabled - mail me if you want to know, and I will check this when I go home this weekend.

For those who are having such a hard time with MiNT 1.08, and are asking for help obtaining the binaries ...

contact Toad Computers (or Atari, or your local dealer, if you have one) and purchase a copy of MultiTOS. It is, after all, what you are really asking for here.

You can also use the precompiled versions of MiNT 0.95 or 0.96, which are readily available.

811. FOR SALE: Mega ST w/ Spectre GCR and other software

Newsgroup: comp.sys.atari.st
Date: 1994-01-12 18:48:46 UTC
From: barber@sugar.neosoft.com
Message-ID: <barber-120194123223@pvillage.neosoft.com>
Source record: 195151

I've got a Mega ST 2 that I would like to sell. It's sitting in the closet
all
boxed up and I want to find it a happy home.

4 megs ram
40 meg Supra internal HD
Mac emulator - Spectre w/ GCR for read/write to Mac floppies
I still only have 800k drives so you can't write to Mac HD
floppies
external 800 floppy drive
monichrome monitor
color monitor
1200 baud modem, useful as a doorstop or large paperweight

software includes:
WordPerfect
WordWriter
GFA Basic
Cad 3D
Publishing Partner
NeoDesk
LOTS of PD disks from Current Notes (DC Metro area user group) for ST
and Spectre; START; ST-Xpress; etc etc etc - probably close to 100 floppies

for the Mac side:
System 6 for Spectre
many PD disks for Macintosh
Mac paritions of the HD include MS Word, Freehand, Illustrator, PD games

I would like to get as close to $1000 as possible for all of this. Would
work
out shipping details with buyer - for something this big I would probably
send
UPS insured. I sent out my ST once before this way to have the Supra drive
worked on and the machine survived going out and coming back. Still have
the
original box for the ST.

I have been out of the ST world for a while for pricing, so let me know if
my
price seems too high.

Seriously, If you have an ST or a TT, it's under $40.00 from Toad.
Only the latest "Falcon compatable" version is $80.00

There is a cheaper package without the full manual available in the "Falcon compatable" version

Well I bought mine from Atari Workshop/System Solutions, just having shuffled through lots of bits of paper to find out I think it cost me about 15 quid. ;-)

Just a standard 290dpi (IIRC) mechanical one, called 'Itsa Mouse' according to the box and very nice it is too. :-)

> I see you having trouble with some QWK reader program called UQWK?!

For what it's worth, uqwk is not a QWK reader. It's not even a piece of Atari software. It runs on Unix and packs Internet mail and Usenet news into a QWK, SOUP, or ZipNews packet for offline reading. It supports replies, NNTP, has an offline command language, etc.

ftp.gte.com:/pub/uqwk/uqwk1.7.tar.Z or I'd be happy to email it.

There's lots of discussion about uqwk and readers that work with it in alt.usenet.offline-reader.

(If there really is a piece of Atari software with the same name, I apologize for the confusion.)

817. Atari 8bit or ST emulators for MSDOS or Unix ??

Newsgroup: comp.sys.atari.st
Date: 1994-01-12 20:46:53 UTC
From: natasha@zwicky.unm.edu
Message-ID: <2h1njtINNcp7@lynx.unm.edu>
Source record: 195162
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I currently have an AMD 486DX/40 with MSDOS 6.0 and Linux OS's.
And from my more memorable computing days an Atari 1050 disk drive with
lots of old programs. All of which are unusable since I traded in my
130XE a couple of years ago....

I have recently heard that there is an atari 8bit emulator that can load
programs off the 1050 drive through the PC joystick port.

Does anybody know where this can be found and/or purchased?

I also would like to know where a cable that would adapt an atari serial into
the joystick port could be found or how it could be made?

I remember hearing a couple of years ago that someone was writing an
atari emulator for Unix on the net; has anybody heard anything about this
lately?

I appreciate any comments and help! I have so far run into several dead-ends..
Please reply via e-mail.

Thank You

Marc Bluefire

Greetings!
I have a simple question abut the 1040stf.
Can it handle one of today`s 14.4k baud modems? I seem to recall someone
from the past being able to connect a Courier HST Dual Standard andhad
no problems with it.
Also..If anyone knows how to connect HDs to one of these machine I
have a friend who needs to know what kind of HD to buy (ie. RLL MFM ODE etc.).
thanks in advance!
-Jesse

823. UPLOAD: New games

Newsgroup: comp.sys.atari.st
Date: 1994-01-12 22:16:07 UTC
From: ae-a@minster.york.ac.uk
Message-ID: <758412966.11921@minster.york.ac.uk>
Source record: 195175

I have uploaded the following ATARI-ST programs to
atari.archive.umich.edu in /atari/New (they will shortly move
to atari/Games)
(I have also uploaded them to ftp.tu-clausthal.de but it will take
ages before they are available there).

pacmen.zip (game)
3d_ski.zip (game)
alienation.zip (game)

I have also uploaded re-compiled versions of some of my earlier programs.
These shouls replace their lzh versions.

linecras.zip (game)
mazewar.zip (game)
video_g1.zip (game)

All of these files work on STs with 0.5 meg and colour monitor and should work
on all versions of TOS (perhaps someone would be kind enough to tell me
which programs work on which TOS/type of ST)

PACMEN (pacmen.zip)
This is a version of Pacman that can be played by up to eight players
using the Paralell Joystick interface and the STE's Joystick ports to
add the extra joysticks. You can play it with less than 8 players,
and the remaining players are either computer controled, or turned off.
The other addition to pacman is that each player has a missile, and
infinate lives. The game ends when all the dots are eaten.

3D SKI (3d_ski.zip)
Guide an egotistic robot down a ski-slope and avoid falling off
and coliding with rocks. Includes sourcecode in STOS basic.

ALIENATION (alienate.zip)
Platforms and ladders game similar to Mr. Robot on the 8 bit computers.
Navigate your robot around the obstacles and grab all the pills within
a time limit. You can also design your own levels with the built in
construction kit. Includes sourcecode in STOS basic.

The following uploads replace existing games. They have been re-compiled
and should run on more STs.

LINE CRASH (linecras.zip) (REPLACES linecras.lzh)
This is a game that uses the extra joystick ports on the STE and the
printer port joystick adaptor to allow up to 8 joysticks to be added
(although less than eight people can play). On ST computers without
the two extra joystickports on the side, up to four people can play.

The idea is to trap your opponents in the style of TRON lightcycles (ie, you leave a line behind your vehicle), and avoid being trapped yourself.
Included in the LZH archive are docs for building your own joystickadaptors.
Written using STOS basic.

MAZEWAR ST (mazewar.zip) (REPLACES mazewar.lzh)
This is another game for 0 to 8 players. The idea of this game is simple. Shoot your opponents while avoiding being shot yourself. Eight tanks (some can be computer controlled) negotiate a maze. Some walls are indestructable, and some can be shot.
Included in the LZH archive are docs for building your own joystickadaptors.
Written using STOS basic.

VIDEO GAMES I v 0.5 (video_g1.zip) (REPLACES video_g1.lzh)
Play three games at once on the same ST with the same joystick.
Yes, it is possible. You can simultaneously play Pacman, space invaders, and pong, using combinations of movements of one joystick. Each game is overlayed transparently on top of the other games.
Written using STOS basic.

I have written all of these programs myself, and they are Freeware/shareware/public domain.

Please mail me any comments, etc.

Andrei Ellman (ae-a@minster.york.ac.uk)

824. Kick Off 2 and a question about "broken" games

Newsgroup: comp.sys.atari.st
Date: 1994-01-12 22:54:15 UTC
From: kllove@tiger.ecn.uoknor.edu
Message-ID: <2h1v2n$q@constellation.ecn.uoknor.edu>
Source record: 195166

Does anybody know how to copy this game? I recently purchased it from someone on the net and I want to play off a backup. I've tried Acopy 1.3, Procopy 1.5, and Procopy 1.7 with no success.

Is it possible to install it on a hard drive?

The other question (questions actually) I have are about the legality of breaking/cracking a game/application.

If I legally purchased a game, then is it legal to obtain a copy with manual/disk protection disabled/removed? What if I did it myself (not that I am able to do this, but if I could...)? Of course I would not distribute such a copy to anyone else; whether their copy was legally purchased or otherwise.

Just wondering,
Kenneth Love

826. RomSpeed

Newsgroup: comp.sys.atari.st
Date: 1994-01-12 23:36:08 UTC
From: S.P.Taylor@bradford.ac.uk
Message-ID: <1994Jan12.233608.17566@bradford.ac.uk>
Source record: 195168

Hello.

Romspeed is a program which does a similar job to Gemram - that is it loads the OS into Ram, thus enabling programs such as SHBUF and WinX to modify it. It seems to do this job better than GemRam, in that it works on more than one of these programs, and also maintains compatibility with DeskPic on the Falcon.

I was given this program, and led to beleive that it was PD, although no DOC files were attached - it merely came as part of WinX.

Recent comments from 'Yat@Lexicor' however suggest otherwise. I quote...
'Might I point out to you that Romspeed is NOT free to anyone.'

Can someone please clarify the situation, as I would not like to be unwittingly using Shareware or Commercial software without paying for it, would I?

Steve Taylor.

827. Atari CD-ROM

Newsgroup: comp.sys.atari.st

Since no-one else has done it yet...

This is from the latest Walnut Creek CD ROM catalogue. The disc should also be available from most serious vendors.

GEMini Atari CDROM. 2872 of programs for the Atari in 616 MB. These files are for the Atari ST, TT and Falcon Computers plus a section for the Porfolio palmtop computer. You also get text files and graphics for the Lynx and Jaguar video game system. All programs are ready to run directly from the CDROM. Each directory contains an index and a list of files to make it easier for a user to locate a file. Programs and files in groups such as accessories, archivers, astonomy, database, utilities, fonts, games, gnu, programming, scree savers, virus, text editors. 50 megabytes of games and entertainment software. 15 megabytes of fonts. Lots of source code. You can install the GEMini CDROM on an Atari or MSDOS BBS. All the noncompressed files have a compressed version in the zip folder. BBS operators can easily make thousands of Atari files available to their users. You get PCBoard, Opus, Wildcat, RBBS, Spitfire, and Maximus index files. This CDROM was made in Dec 1993 by Eric Tremblay and Rene Guimont. The price is $39.95.

>3,5"
>>with cable and box.
>^^^^^^^^^^^^^^^^^^^
>
>Hmm.. do you get cables and box with the Conner 240 Mb 2.5" drive???
>
>And what will you do with the old internal 2.5" HD???
>
>If you buy SCSI, then you can ADD it to your system... If you get IDE
>you must
>get rid of the old one first...

Well, the answer's quite simple.

First, as an Atari dealer, I can order Falcon030 without hard disk, but
with mounting material, and then add any 2,5" IDE drive my customers want.

Second, as a customer, you can order the same thing from your Atari dealer
and add any drive you might already have.

So where's the problem?

btw, the 240 MB Conner drive is really fast - 1600 KB/s GEMDOS read
throughput and stunningly fast file access time.

bye, Peter

830. Problems with Lattice C 5.0 and Word Writer ST

Newsgroup: comp.sys.atari.st
Date: 1994-01-13 00:47:08 UTC
From: kllove@tiger.ecn.uoknor.edu
Message-ID: <2h25mc$5jh@constellation.ecn.uoknor.edu>
Source record: 195173

I've been using my ST recently to write some simple C programs and I've been trying out a few of the options in Lattice C v5.0.x (I think the x is a 6, but I'm not sure). When I click on the "About..." item in the menu I get 2 bombs and then I'm returned to the desktop. When I get there, I can move the mouse but I can't select any menu items, close/open windows, or select icons/files.

I've tried reinstalling to my hard drive with no luck. I have never installed it to floppy so I don't know if it does the same thing in that case. I have an ICD AdSCSI+, ICD Utils v5.4.2, Warp 9 v3.75, UIS III v3.11, and FATSPEED (not in that order) running. For desk accessories I have UIS III, XCONTROL, and WARP 9 running.

On to my other problem. I use Word Writer ST v2.0x for editing simple reports/articles (and vi for text editing, of course :). The other night I was writing up a short review of my Jaguar (I hope to include it in the next edition of the local ST club's newsletter). After typing for about 30 minutes, the computer started typing by itself!

After about 20 seconds of this, I got 4 bombs and was returned to the desktop. Things seemed to be okay, but I didn't take any chances and re-booted.

Does anyone have any ideas on what either of these problems are and how to fix them?

adTHANKSvance,
Kenneth Love

Yes, you do need to send in your original NeoDesk Disk(s). Just one if
its one of the European double sided ones, or the Master and Extras disks in
the case of US copies distributed by Gribnif. Also make sure that you have
run REGISTER.PRG on the Master disk. (It deletes itself after running the
first time.) It does say in the newsletters that you need to include the disks
on the third of a page sheet that details NeoDesk upgrades (on the side with
the shipping weights, beside the word Important... :)

The upgrade to NeoDesk 4 includes a full manual. No addendum this time. :)

I can help with Geneva. It will run on an ST with 512k, but you would be
limited to only small applications, and you certainly wouldn't be able to
run very many, unless they were _really_ small. We do recommend at least
1 meg, and 2 is better, particulary if you want to be able to take advantage
of running several applications.

Geneva is faster than MultiTOS, and a lot more compatible with older programs.

I heard about it from my father, who uses a Mac at work, and watches a Mac
mailing list. It was nice to just set in the same spot my 2400 Supra used
to occupy, plug in the same cables (save power supply), and go. I found that
when it is connected to a carrier, it even cuts off the line to the phone
plugged into it, so I can't toast my own connection by picking up the phone on
my desk to call someone. (Yeah, I've done it, too many times...)

> Might also check the error-correction and compression settings(MNP..vbis...)

True. I found that the MNP reliablility didn't get along with the host I
used the most often. I also changed the carrier detect as you did. I find,
however, that even when downloading pre-compressed files I still get transfer
rates over 14.4 when using compression. I also changed the DTR setting, so
that I could hang up just by dropping DTR. (AT&D2)

>There also exists a text file with all the ATS settings (and choices)available
>on GEnie (I'll post it to atari.archive if someone already hasn't). This is
>helpful as they didn't list the settings in the manual (a really dumb move,
>I think)...

The manual included with mine was pitiful at best, but it did have a list of
all of the modem's AT commands, with _extremely_ brief descriptions.

There is not really a "newer" version, but there are two different versions
out there (from two different sets of authors, I believe). Each has problems,
but one is a bit more stable than the other (with my setup, at least).
Check out some of the German sites, as I cannot remember exactly where I got
it (it was a non-US site though). I seem to remember that the fancier one
is more buggy.

If all else fails, email me.

I am using a 14400 on my Mega2ST, which is functionally no different in
terms of modem usage. So, yes you can use fast modems. You are limited
to 19200 baud without hardware modifications, but I find this to be plenty
fast (I get 1550-1600 CPS sustained during Zmodem binaries downloads).

> Also..If anyone knows how to connect HDs to one of these machine I

He/she wants a SCSI, and a host adaptor. Toad Computers (1-800-448-TOAD) can
help with ST hard disks. Hope this helps.

Are there any plans for preemptive multitasking in the future?
I've heard that work is being done on MiNT compatibility--is this
true, and if so, how does it compare with MultiTOS then? Does it
use interrupts to handle mouse events, or does it poll (which
seems to be one of the slowdowns in MultiTOS)? Also, does
it allow one program to run while another is waiting for disk
I/O?

Along the same lines, does anyone know if any work on eliminating
the polling and freeing up the CPU during I/O are being done
on MultiTOS? It seems that changing these two things alone would
greatly speed things up.

> (mjuschke@tartarus.uwa.edu.au OR
> mjuschke@lethe.uwa.edu.au)

Thanks to all the people who replied via email, some information was
quite useful even though it did not solve this particular problem.

I discovered what the problem is a few days ago.

It seems, that STraightfax has no speed problems when running with a slow fax at 2400 baud.
With a 9600 baud fax, however, it seems to mind if I have QuickST and BeforeDawn running on my MST2. For some reason, they steal enough time to stuff up fax receptions at 9600.
Simmilarly it seems, that the same thing caused the inability to send multi-page faxes in one go (it could never get the page acknowledge right and would break off).

I discovered this when I accidentally booted a clean system, didn't want to re-boot and ran STraightfax, which suddenly worked as it was supposed to.
I didn't think that these accessories would matter that much, as everything else works fine. (I have no other 9600 baud program, however).

Well, I guess, booting a clean system should always be a good idea when trouble shooting, even if nothing bombs.

Bye

Michael

I have several of them I have gotten from several places. One I got from the umich archive in Games. It is called 4_7_11 and contains three variations including the standard Klondike. I also have one that is mono only called Patience. I got it from GEnie. I have one that is a desk accessory, but I think it had problems (not being able to play another game after finishing one unless you won?). I got this one from GEnie as well. I also got a package that included Klondike and Canfield written in GFA Basic from GEnie. These may also be available on umich, but I don't know.

I'm not entirely sure what your trying to achieve here. Titan Designs in the Uk are soon to be releasing a genlock that will allow you to overlay Falcon output with video images. If you don't add a video image I'd guess you'd still be getting a correctly synced Falcon output. Maybe.

I can clarify this because I`m the author of Romspeed.

What Yat told you is (or was, see below :)) correct: Romspeed is part of the
Outside package (virtual memory manger for TT and Falcon030) distributed in
the US and UK by Lexicor. Romspeed up to now wasn`t available for free.

Because there were several users that asked me if Romspeed would ever be
available for free I finally decided to give Romspeed the status of
Freeware. In other words, from now on the program may be distributed freely.
(This only applies for Romspeed, of course, not for Outside.)

Maybe in the near future I'll add English docs to it upload it to
ftp.uni-kl.de. Have fun with Romspeed.

Gemram makes only a copy of the Gem part from ROM to RAM, not the complete
TOS image. I'm not familiar with Romspeed, but I suspect that it does copy
all of ROM to RAM.

> I was given this program, and led to beleive that it was PD, although no

There is a freeware program called Romram (by Alexander Herzlinger) that
copies the complete TOS image from ROM to RAM, or optionally loads a TOS
image from disk.

Regards,
Waldi (walra%moacs11@nl.net)

855. PGP for Atari?

>side on the unix box with the code provided, the distribution is
>pretty stand-alone as is... What problems were you having??

No, I don't have any real problems. But I would like to see a bit more
documentation about the client on the Atari site.

First, I miss something like the history buffer like in an xterm. There is
a menu switch to turn the sliders on and off, but they are only useful, when
you want resize your window, but not the terminal.
Maybe I miss something here, but does 'win.prg' support such a history feature?

Second, there is only support for an adm31 terminal. I would like to have
vt100 emulation too. How about that?

862. MultiDialog 1.03 released

Newsgroup: comp.sys.atari.st
Date: 1994-01-13 13:58:06 UTC
From: hn@limotoc.informatik.rwth-aachen.de
Message-ID: <hn.758469486@limotoc>
Source record: 195104

As the subject says MultiDialog 1.03 is available. So here is some
further information:

Program type: AES-extension, puts nearly any GEM-dialogbox into a
GEM-Window. The result is that you can access the
menu-bar or other applications while a dialog is
running.

Operatingsystem: MultiTOS/TOS (MultiTOS recommended)
(according to a mail MultiDialog works on Geneva, too.)

Newest version: 1.03 (from December, 21th 1993)

Archive name: mdial103.zip

New features: - Keyboard shortcuts via Oliver Scheel's Let'em Fly
(so get LTMF 1.20, too)
- CPX module for configuration
- higher stability
- specification of an programmers interface
- and a lot of small but important bugfixes...

Distribution: FTP: ftp.informatik.rwth-aachen.de
(pub/atari/mint)

atari.archive.umich.edu
In case of doubt: ask Uncle Archie!

Same as FPATCH2. You only need one of them!

These programs are not the same - fpatch2 = bmapfix which fix the falcon bios, bmapfix2 traps errors caused by programs which don't expect to have bios 6 connected to a LAN rather than modem port.

Yup! I second that. And that goes for colour depth as well...

>Check out ProCalc (should be on atari.archive)... I use it in any res
>(it's a pity I'm limited to ST resolutions), though it is rather large.

The German SciCalc accessory is also very good (and quite large). I got
another one with MTOS which might be ProCalc, I use it so seldom. There's a
decent one for the XControl Panel as well.

>Anyway, can someone give me the pin connections for wiring up a lead t
>connect an STe to a SCART socket.

Using RGB or COMPOSITE (the latter needs fewer leads in the cable)
I have a composite cable (but still using a SCART-plug) on my MEGA STE

>are fine, even tried different speakers too...

Did you connect your CD's line out to the Falcon's Microphone input?
If so, you might have blown the input.
To feed a "line out" signal into the Falcon, you'll need a 200 KOhm
resistor in the left and right signal lines to attenuate to microphone
level.

>NVRAM?

Somewhere on your Falcon's disks, there is a program CONFIG.APP. It resets
the NVRAM if necessary, then lets you choose language and keyboard.

>as I don't have a Falcon yet.

The GEMAR package includes a MultiTOS file system driver for SCSI
streamers. It works on ACSI, TT and Falcon SCSI, and provides either
direct access to the tape's contents and an interface for GNU-Tar.

Yeh, OK, the following _is_ a bit of wasted bandwidth, but I thought a bit of humor might be worth it. Enjoy.

-Hutch- @ Fair Dinkum Tech

==========

This item comes to me via the following hand-offs:

bzs@ussr.std.com (Barry Shein) => christophe@taligent.com (Christopher Pettus) => Micah Doyle => diane_olsen@genmagic.genmagic.com) => victor @whyanext.com (Victor Schwartz) => dunham@devnull.mpd.tandem.com (Jerry Dunham)

Q. How many USENET posters does it take to change a lightbulb?

A1. Define "change"

A2. How do you know the lightbulb is out?

A3. Don't use the word "posters" to describe us, it's offensive to large sheets of papers with pictures on them which hang on walls.

A4. That question is not appropriate for this group, please take it elsewhere.

A5. I think it's perfectly appropriate, this is alt.fan.lightbulbs.

A6. Well, that's because you're a twit.

A7. Who are you calling a "twit"? Besides, you spelled "twit" wrong.

A8. Oh? And how exactly do *you* spell "twit", twit?

A9. Could you two take this to e-mail? Doesn't anyone want to talk about lightbulb fans instead of flaming?

A10. You're a twit also, who died and made you net.cop?

A11. Look, all of you, take it to alt.flame or e-mail or something.

A12. Hey, USENET is an anarchy, you have no right to tell them what to post or not post.

A13. Speaking of anarchists, why don't you all vote for Andre Marrou, Libertarian Party Candidate for President?

A14. Because the Libertarians are all twits.

A15. Waitaminit! Now we're arguing politics on alt.fan.lightbulb????

A16. Stop wasting bandwidth with this stuff!

A17. What "stuff" pray tell?

A18. Yikes! It's dark in here!

A19. Define "dark".

A20. I mean the lightbulb must be out.

A21. So change it.

A22. Define "change"...

: |> much does it cost?
: mono X windows but was a pretty full implementation with some nice development
: tools. It is no longer being developed AFAIK although Atari Uk told me they would
: expensive. From memory it cost something like 2500GBP.

Interesting. I spoke with Bob brodie just before Xmas looking for the
Atari Unix to run as part of this site, and he told me there was baisclly
no product for the USA. The development team had been disbanded. While
Atari did have the beta releases it had no final version.

however it would appeare Atari Inc did not have any left in stock :(

If someone does have a copy (yes the beta one) and wants to part with it
even if you have found it buggy I would be very interested in hearing
from you.

It would look good running X on the 19 inch monitor next to the 17 inch
Suns here [grin].

If I remember corectly, the bad accuracy (this is of course relativly)
of the Mac DTP softwares is caused by limitations in Postscript.
If this is correct, inaccuracy wil be re-introduced in the conversion
from Calamus to Mac. You could contact Stena Scanfors (if memory
serves me right) in sweden to get more info...

896. Help! Bj200 Driver(s) needed.

Newsgroup: comp.sys.atari.st
Date: 1994-01-13 21:00:43 UTC
From: gregs@eskimo.com
Message-ID: <CJL6D9.Apz@eskimo.com>
Source record: 195058

I recently bought a Canon Bubble-Jet BJ-200 printer, but I'm having trouble printing from several applications.

I can get it to work rather well when I'm emulating an Epson LQ, but I would rather use this printer in "Canon Mode" so I can get full 360x360 dpi. However, none of my applications has a driver for this printer. Some of them come close, like Calamus 1.09 -- but it's still flakey. To make matters worse, the only driver that works correctly with Redactuer-3 will only work in Epson-Mode emulations, and it will only allow me to print in the Roman font (!).

SO - If anyone has a driver for the Canon BJ-200 that will work with: Calamus 1.09n or Redacteur-3 PLEASE email me a copy, or if you managed to get around the emulation problems some how tell me how you did it. It's rather frustrating to buy a new printer and find you cannot fully use it.

Thanks for any help...

Cross-posted to: uva.want-ads,comp.sys.atari.st

(pardon the double-spacing:my ancient CPM laptop is fussy)

Magnavox 8cm-515 color monitor w/ custom cable for Atari ST.

Better than Atari; 13" (vs. 12), sharper pic, better made,

use with IBM-comp's, Amiga, and composite-video machines

(Atari 8-bit, C=64, VCR, laserdisc player) as well.

640x240, analog & ttl-rgb, & composite-video & green-screen.

* Includes $40 custom 8' cable for Atari ST; separate sound

jack for running sound thru stereo.

* FANTASTIC picture when used w/vcr or ld as hi-res tv; better

than any tv-set! Ideal for one needing both monitor and tv

in a small space. Can even have BOTH on and switch between!

Excellent condition.

$200 or best offer. Call (804)295-9995 or

send email to tipi@vivaldi.acc.virginia.edu

>for here.
Except that you'll probably get MiNT 1.04 which also means al sorts of nice
little bugs will make it crash when using external filesystems. I've lost
count of the number of bug reports to Minixfs I've received which are due to
1.04 (regular crashes) or 0.95 (loads twice).
Or better still nice messages squealing loudly about how buggy Minixfs
is on Usenet.
Personally I don't see why Atari can't release later binaries for
MiNT which will *only* run under MultiTOS.
Steve.

Hi Bob !
I heard a lot of "Geneva" now during the last months. I don't know if it
can be bought in Germany. Anyway, i'd like to know if it is possible to
run Geneva together with MiNT, especially because i like the fast MinixFS
very much. I do a lot of work using *IX Tools and Software. So i probably
"couldn't live anymore" without the long filenames, MinixFS supports.
Any informations about that ?

I am looking for a used Hard Drive in GOOD condition. Would like one over 65 megs that is already mounted in a host adpapter, with cables, ready to plug into my ole ST and use....files welcomed. Please remember I am looking for a used HD, not a used one at a New Price! Guaranteed not to be dead on arrival or seriously ill. <Thank you, and good nite!>

That is a good point. I thought that -DMULTITOS actually did
stop mint from working under normal tos. (Or maybe that was only true
when you couldn't turn mem_prot off by renaming the executable.)

>email and News?

Working on a Novell environment, it is quite easy form me to define different signature files for different applications. Both PMail (eMail-tool) and the newsreader allow to specify .SIG-files, that need not necessarily to be the same.

In fact, I don't know anything about restrictions in UNIX, as far as those SIGs are concerned.

Or you could use some attenuators inline. Tandy in the States do a vesion, which I've not been able to locate in the UK. The 40db attenuators reduded the signal nicely for me. I've now switched over to using a variable input module made up for me by a friend. That allows me to reveive different source sounds from the TV, video, tuner, tape, record deck, or CD, works well enough.

> to use.

I've got it... and I'm very happy with it. Yes, you can use it on a 512K system... but there really isn't much RAM left over to run much of anything. With 4MB of RAM you should be rather happy though.

Geneva isn't exactly a replacement for MultiTOS or MiNT. It really depends on exactly what you want to do. Geneva really works well as a co-operative multitasking system... but it won't multitask TOS programs too well. It is rather speedy as there is no noticable slowdown with several GEM programs (and accessories) plugging away. It is a quality product so buy it ASAP. You won't regret it.

The developers were MARVIN AG. And it was not in ST-Magazin, it was a projet of
the TOS (magazine out of business since 8/93).

They only sold versions with software something like 0.3 BETA and it worked
like that.
It should enable you to get all TT modes on the ST - but only had TT-Mid with
lot of p[roblems.
Never heared anything new about it since beginig of '92

AFAIK, the desktop is always managed by the SCRENMGR, even if you
install your own. That means that you never get any redraw messages
for it. The only way to notice redraws is to use USERDEF objects.

Whoops... you are right. Sorry. What I meant was the redraw I *send* to the desktop because I have moved some icon or so.... The effect is the same, though. As said before, it is possible to get a redraw for a window that strictly speaking doesn't need a redraw.

Thanks for correcting me.

Greetings,

--- Marcel.

There was one that's pretty much identical to tin distributed with
Hermes, it's called TASS I think.
As with Tin though, it doesn't have a GUI. I prefer the GUI when reading
news... even though I don't use the mouse. (The GUI is hot keyed.)

Yes it can, but you are restricted to the 19200 bps serial port speed
of the STF (meaning that you won't be able to use all of the modems
speed when transferring uncompressed data. However, readily compressed
files will be transferred as fast as on any other machine). The
HST-modems they sell now can establish a 21600 bps connection if there
is an identical modem on the other end. If using a modem capable of
over 19200 bps uncompressed troughput, I think the modem will sense
the serial port speed of 19200 bps and refuse to connect at any higher
speed. But ordinary V.32bis modems should be no problem for the STF.

Oh,

is there a relativly fast and good programm of that kind for the ST???
Could someone tell me where to get and how much it would be?
Is there a demo-version somewhere?

Bye ...Patrick.

Autoroute for the ST was the same as Autoroute for the PC ie bloody good. It covered GB only and wasn't available for other countries but I could be wrong on that. Anyway, it started out at 150GBP. Got pirated to death. Dropped to 50GBP and when they all sold in days, that was it. No more made. The company was quite rightly pissed at being pirated and pulled the ST version. Updated map disks were available for a little while afterwards and then they stopped those as well.

Hi Glenn,

my name is Ralf, and I work for Cybercube Research Ltd.

Cybercube is developing the TT-Accelerator boards called CyReL
CaTTamaran. These modules boost the overall performance of your
system by at least 33%. A new model is under development which
will give you a performance gain of 50%. Installation is rather
simple, although you have to cut one wire and solder one point.
The rest is plug and play. SRP is US $99. I have to inquire
about the availability, since they have not been 'officially
released' yet.

If you need any more infos, please let me know.

Ralf.

They most certainly do exist - they're probably the premier company in their
field and the current Windows versions of their products are superb. They do
European maps and possibly US too, All in full color with the maps drawn on
screen as well as local places of interest, pubs, hotels etc. depending on your
needs. The pro versions are used by haulage firms as you can enter a list of
destinations and start times and it will work out the best route between them all.

I'm fairly sure that many of those functions are only available if you run it with GENEVA. I purchased GENEVA recently (about 6 weeks ago) and am using it with Neodesk 3.04 currently. I am EXTREMELY impressed. It is fairly easy to set up, it's very very fast, and takes *far* less memory than any MultiTOS configuration I've yet seen. The features are almost too numerous to mention, but the 3D look, the detachable menus, and the ability to set about 12 flags for every single program you have (and save those setings of course) are all wonderful. So far I've gotten it to work with *very nearly* every program I have, and I run a lot of old software. The only weak spot is the task manager, which tells you what processes are running, and whether or not they are asleep or not, but does not tell you how much RAM eash is taking up, or how much processor time. It is one of the best products I've ever seen for the ST...

942. (info) A note from the new sources/binaries moderator

Newsgroup: comp.sys.atari.st
Date: 1994-01-14 16:44:34 UTC
From: avg@cwi.nl
Message-ID: <CJMp6A.MK2@cwi.nl>
Source record: 195070
Cross-posted to: comp.binaries.atari.st,comp.sources.atari.st,comp.sys.atari.st

Hello everybody.

As Steven Grimm decided to devote his time to other matters, I will from now on be the moderator for the comp.binaries.atari.st and comp.sources.atari.st groups. You will not see many changes. The posting conventions have not changed more than slightly. It is as yet unclear what is going to happen to the archives Steven kept. Therefore you should be aware that it may not be possible to retrieve earlier postings when they have expired.

Please take note of the following issues:

- Submissions to both the binaries and sources groups should now be sent to the following e-mail address:

avg@cwi.nl

- As ftp archives are becoming a popular alternative for publication of sources and binaries, I will encourage the submission of announcements for uploads to ftp archives. Archive maintainers, feel free to include a note in your uploading instructions encouraging people to submit a short description of their publications to my e-mail address.

- Although I certainly try to do things as well as Steven, I may of course make mistakes in the beginning. In that case, sorry for any inconvenience. Never hesitate to let me know if something is not quite the way you would like to see it.

- For those who have submitted articles to the old addresses, I am working on those. I will post one submission to both groups today, to see if everything works out well. The others will follow soon. If I haven't contacted you about your submission, then either it's still in examination, or it looks OK and it will soon be posted.

Of course, I always appreciate any comments or ideas on how to improve the usefulness of the groups.

I think we'd all like to thank Steven Grimm for the great work he has been doing for the groups. I am also endebted to him for his advice and tools for maintaining the groups.

Thank you all very much and enjoy,

Annius Groenink, Moderator. (avg@cwi.nl)

943. coding party

T
****

THESE ARE A PREVIEWTEXT FOR THE FRIED BITS 2!. SPREAD IT! BUT DON'T FORGET - ALL INFORMATIONS COULD BE CHANGED.....

Invitation Text V 0.1a ---------- 17.12.1993

After the big success of the "Fried Bits Eastern Coding Convention" many people asked us to have a second party. So we'll do it!! This Text is the pre - preview invitation for the:

FRIED BITS EASTERN CODING CONVENTION 2!

organized by THE INDEPENDENT.

The party will be held from the: 01.04.93 - 04.04.93 in Bremen.

Now some information about the fourthcoming Party. We await about 100 - 200 peolpe.This time we hope to arrange a party together with the Archimedes scene.The main reason,why we make the party together with the Archimedes scene is, that we would make better contacts between ATARI- und ARCHIMEDESCODER, GFX- and MUSIC-men and stop the prejudice between the machines.In the next time we want to get in touch with Archimedes groups like:Bytepool, Armaxxes and if they interested we will see...

At this time many good Atari Groups would come., e.g. Aura, Lazer, NPG, Newline, Inter, Animal Mine, Channel 38, The Avengers, Risk, The Respectables, Mugwumps, Synergy, Sanity (Amiga), Sentry, Light and so on.

This time there will be the following Competitions:

Single Competitions

Falcon Demo Competition
Archimeds Demo Competition

2 in 1 Competitions

Falcon & Archimedes Grafix Competition
Falcon & Archimedes Music Competition

In the next time we get in touch with the german computermagazin ST-Computer and with ATARI to arrange some prices and so on. We try to get some ATARI-JAGUARS for the Competitions. If the convention held together with the Archimedes scene, they would arrange prices too.

The entrance-fee will be about 20 - 25 DM. Food and drinks will be sold in the house 24h long, McDonalds is about 1,5 km away, Pizza Service is arranged and a supermarket is about 300 m away. Sleeping places are in the house (don't forget a blanket).

Alcohol is allowed, but if someone flips out we will kick him immediatly.

All information you have read are not 100% sure at this time! All informations could be changed!!!!!! This text is only the preview-invitation,the real Invitation will be following with a invitation dentro for the Falcon and perhaps for the Archimedes in the next time!!!!!!!!!!

For more information about the party write to:

947. v20inf001: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1994-01-14 17:26:13 UTC
From: avg@cwi.nl
Message-ID: <CJMr3q.9K@cwi.nl>
Source record: 195075
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 20, Info 2

This article is posted regularly. It gives a short introduction to comp.binaries.atari.st and describes how to submit binaries to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.binaries.atari.st

The moderated usenet group comp.binaries.atari.st contains publications or announcements of binary packages for Atari TOS computers. The publications on comp.binaries.atari.st may be freely distributed as long as no modifications are made to the packages. The packages may contain public domain software, shareware or demos of commercial programs.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.binaries.atari.st.

SUBMITTING BINARIES FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg. Note that comp.binaries.atari.st is not the correct place to ask general questions or to ask, "Does anyone have software that does X?" Post such requests to comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected. If necessary, I may put the description through a text formatter or make minor additions in order to make the postings to the group more uniform. I will, of course, never change the actual contents of a submission.

If possible, submit your binaries in a Zoo 2.1 archive. I will generally check that everything in the archive is OK and that the files in the archive make sense on an ordinary Atari ST system (i.e. they are MS-DOS style files), unless the archive is specifically intended for use with an alternative file system such as Minixfs. If necessary, I will re-pack the binaries using Zoo 2.1.

If you are submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. But feel free to post demo versions. Submissions which I feel are of an excessively commercial nature will not be posted.

THE STRUCTURE OF COMP.BINARIES.ATARI.ST ARTICLES

There are three types of articles in comp.binaries.atari.st: "information postings", "binaries" and "announcements". The binary postings are also called "Issues". The type of a posting can be distinguished by the subject line:

Subject: v6inf001: Introduction to comp.binaries.atari.st

This first word in the title identifies this as the first info posting of volume six. Similarly, the subject line shown below:

Subject: v20i081 (binary): deadwrtr -- Ouija-word processor part01/01

identifies this as the 81st issue in Volume 20, and it's a binary posting. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v20i041 (binary): pet -- CBM PET emulator part04/39

The "References:" line, if present, points to the previous part of a multi- part program, so that newsreaders (trn, tin, nn, etc.) which can

follow threads will recognize a large program as a single thread.

Reports of submissions of binaries to ftp sites such as atari.archive.umich.edu are also considered for publication. Subject lines for such articles are like the following:

Subject: v20ann015: Edith Professional -- Desktop Text Editress, demo

The first few lines of an article's body are auxiliary headers that look like this:

Submitted-by: jackt@atari.com (Jack Tramiel)
Environment: high resolution, tt
Posting-number: Volume 19, Issue 80
Archive-name: rsn
Supersedes: atw: Volume 10, Issue 10-15

"Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site. This will usually be the same as the "From:" line in the article's main header.

Certain information about the system configuration required to use the program is given on the Environment: line.

Environment: 1meg, medium res, high res

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory. Examples:

high - runs in high resolution (monochrome)
medium - runs in medium resolution
low - runs in low resolution
1meg - needs 1 meg of RAM
ste - requires an STe
tt - requires a TT

The "Posting-number:" line repeats the volume/issue information for the aid of notes sites and automatic archiving programs.

The "Archive-name:" is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

The "Supersedes:" header line, if present, indicates that the program replaces an earlier version.

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-by header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

948. v07inf001: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1994-01-14 17:27:26 UTC
From: avg@cwi.nl
Message-ID: <CJMr5q.AI@cwi.nl>
Source record: 195076
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 7, Info 1

This article is posted regularly. It gives a short introduction to comp.sources.atari.st and describes how to submit sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications or announcements of sources and texts about programming for Atari TOS computers. The publications on comp.sources.atari.st may be freely distributed as long as modifications are documented and the original authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a

while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected. If necessary, I may put the description through a text formatter or make minor additions in order to make the postings to the group more uniform. I will, of course, never change the actual contents of a submission.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are three types of articles in comp.binaries.atari.st: "information postings", "sources" and "announcements". The source postings are also called "Issues". The type of a posting can be distinguished by the subject line:

Subject: v02inf1: Introduction to comp.sources.atari.st

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

Subject: v06i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Announcements of large source packages uploaded to ftp archives are also considered for publication. The subject header for such files looks like

Subject: v07ann007: GCC 7.9.4 -- Same as 7.9.3, but considerably slower

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler
OSS - OSS Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
zoo-high - program is archived (Zoo 2.1 required to unpack)
lharc - program is archived (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

>and it just slowly died off?

We've had this discussion before. No, the traffic wouldn't justify
a 030 group either. I seriously suggest (as I did the last time we had
this discussion---sorry) that we change the groups we have to

comp.sys.atari.tos
comp.sys.atari.tos.tech

which is really what they're about.

952. Re: The Well-Tempred Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-01-14 18:16:07 UTC
From: dbrewood@cix.compulink.co.uk
Message-ID: <CJMtEv.BoI@cix.compulink.co.uk>
Source record: 195091

As I do not have a decent cut and paste available within this editor I'm using at the moment I'll try to explain the function of the programs below and then reply to the message.

>>BOOTKILL - Used in case I screw something up when testing. Press CTRL LEFT SHIFT to disable ACC's, and RIGHT SHIFT to disable AUTO's. From Mark Matts one of th coders in NeST.

>>XBOOT - Commercial boot-up program, supports everything from a GEM like interface.

>>JARXXX - Installs XXX extra cookies spaces in the Cookie Jar.

>>DESKPIC - Allows you to have a 256 colour GIF/IMG file sat on the desktop, makes things a little brighter. Shareware from Germany. At times you need to use GEM-View to reduce the colours in the GIF before loading in as otherwise the palette can get messed up.

>>ROMSPEED - Copies TOS into RAM which allows it to be modified by W!nx, SH_Buf, etc.

>>WINX - TOS multi-patch/modifier, allows up to 40 windows to be opened and allows other modifications to how the GEM desktop works.

>>ENVIRON - Sets environmental variables.

>>FOLDR40 - Fixes the '40 folder' bug, in there as I was told that problems could still be encountered occasionally on the Falcon.

>>FPATCH2 - Official Atari B-Map/DMA sound bug fixer.

>>BMAPFIX2 - Don Maple's excellant little utility to really fix the Bconmap.
>>LETEMFLY - Speeds up desktop operation and gives control over the AES/VDI.

>>FAST_SER - Speeds up the serial port.

>>SLECTRIC - The best alternative file selector for the Falcon.

>>NVDI - VDI replacement package, and accelerator.

>>NVDIFIX - Fix for NVDI bugs when running FalconScreen resoltion expander.

>>BLOWBOOT - BlowUp Hard II, allows me to use an extended resolution of 832 x 530 in 256 colour mode.

>>DMIRROR - Part of Diamond Edge, automatically copies the FAT's to a directory for restoration in case of a crash, can run weekly, daily, or

every time you boot.

>>CACHEV4 - Hard disk cache.

>>SILKMOUS - Mouse accelerator designed to move with natural hand
acceleration.

>>SHBUF16 - Increases the buffer for NEWDESK.INF, allowing you to avoid
corruption of the INF file when the cache overflows. Also allows you to
have loads of installed icons, programs and the like.

>>SAM - System Audio Manager - allow you to assign sound samples to system
events.

>>Works just fine fo me with the folling ACC's; FuzzyClock, SAM Setup,
>>DeskPic, BLow030, and Xcontrol.

FuzzyClock puts the time in the top right hand corner of the screen in 5
minute intervals. MTOS compatable, and works in every resolution I have
found.

I've now added SpeedoGDOS into the above and now have 10.4 megs of memory
free.

As a mater of interest I used to use the Before Dawn screen saver, v1.25,
and it was fine, but since I've upgaded to the full 16 megs of memory it
will not work at all, but locks the machine up. So I use the SilkMouse
screen saver. Not flashy, but it again works in all resolutions.

>I have a Falcon030. I don't have remotely that many things in my AUTO folder

Grin, not many people do!

>I don't know what a lot of them do; some of the others I didn't think did
>anything on the Falcon. I'd like to get my setup right.

Here's hoping the brief list above has helped somewhat. I've been workng
around the system slowly over the last 7 months and the set-up suits me,
although Gem Bench 3.40 reports a speed of 86% compared with a full speed
Falcon in 256 colour mode. But then on a bare machine I can not hit this
figure.

>So I'll presume the above list is a good starting point. Let's (please) have
>a discussion of what each item does, whether it's needed, whether something
>else does an equivalent job, and whether anything else ought to be added. Ok

Grin, I might have killed the discussion dead a little there, but ongoing
correspondance on the merits of each type of program is all to the good
as it benefits us all. If you want any more information on any of the above
just yell out.

Hope the above helps a little.

Message-ID: <CJMtnp.9yC@informatik.uni-rostock.de>
Source record: 195100

Hi,
Now I have my own FALCON, but I do not have a bootselector wich
work on it. Does somebody know where I can get a bootselector
for PRG's and ACC's that will work on my Falcon? I prefer
shareware or public domain software because I am out of money
now. Please send E-mail to bundy@informatik.uni-rostock.de .

Thank's
Holger Janz

954. Quieten my noisy hard disk

Newsgroup: comp.sys.atari.st
Date: 1994-01-14 18:23:06 UTC
From: fountad@vax.sbu.ac.uk
Message-ID: <1994Jan14.182306.4509@vax.sbu.ac.uk>
Source record: 195080

I've got an old Power Computing 900 hard disk (looks like a grey brick
with two lights on the front) which I've had for a couple of years.
Its noisy. I've slowed the fan down with a resitior in the power line,
cut the slits from the fan air intake to leave a big hole, mounted the fan
on rubbery things, etc, but it still makes a racket. I'd like to do
away with the fan altogether, but don't know if this would be healthy for it.
The fan cools a circuit, which must be the Atari to SCSI adaptor (I don't know
much about these things) which does seem to get pretty hot.
Does anyone know if I can do away with the fan without causing damage?
Perhaps a bigger case with lots of ventilation holes would be enough?

Del

> the serial port speed of 19200 bps and refuse to connect at any higher
> speed.

It doesn't really matter that the throughput between modems is faster than
between modem and computer. The modemprotocol combined with RS232 RTS will
take care that no data is lost.

See my previous message posted earlier, but Don's BMAPFIX was sent out on CIX, and should not have spread round internet a fair bit. I think Don reads this group and hopefully can post a copy in here if needed.

>Sound for every key if you want it - how much memory does this guy
>have anyway?

Grin, noly 16mb.

>Oh, that much. Gosh, I can hardly wait to get more memory in my
>Falcon, I don't suppose memory prices have dropped recently or
>anything?

Nope, I had to pay £650 for mine, including the FalconWing unit to hold the SIMMS, and that was with a special low price being given, and a trade in on my old 4Mb of memory. It does cause problems with Dawn 1.25, but appart from that it's nice to have 40 256 colour GIF's open on the screen when using GEM-View.

There's something called TN_PCALC 1.25 which is quite good. You can find
it on ftp.cs.tu-berlin.de pub/atari/Utils/tnpca125.lzh.

There are many others as well.

Yes, but I think the modems would refuse to make a higher connection
rate than the DTE-rate in the first place. At least my modem does
that, if I set the RS-port to eg. 2400 bps, it will never connect at
anything higher than that, whatever the other settings might be. Even
if it would work, it would be a waste to get a modem that is faster
than the computers serial port.

Even though Al Fasoldt did an excellent job on the documentation, you
really don't need it. I and a few others beta-tested Geneva without
documentation for many months; it's one of the easiest programs to use.
His documentation makes it that much better.

The person you're referring to (in the quote) hasn't really used Geneva.

976. Ghostscript 2.61 uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1994-01-14 23:40:29 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <2h7ahd$9ki@geraldo.cc.utexas.edu>
Source record: 194952

Hi,

Ghostscript 2.61 source and executables (for the 68000) are now
available from atari.archive in the Gnustuff/Tos/Ghostscript directory.
Fonts can be obtained from ftp.cs.wisc.edu, prep.ai.mit.edu, ftp.uu.net,
or other unix software sites. For the uninitiated, Ghostscript is the
GNU project's PostScript language interpreter. It can be used to display
PostScript on the screen, or to print PS to non-PS printers.

Would anyone like to volunteer to compile and upload an executable for
the 030 machines? I don't have enough time or diskspace to do this
myself. By the way, what happened to the 030 executable of 2.52 that was
at ftp.uni-stuttgart.de?

I will maintain another copy of GS on lifshitz.ph.utexas.edu in
pub/atari/ghostscript, for those who have trouble getting to
atari.archive. I suspect that most GS users long ago got the beta
version of 2.61 from lifshitz.

The main difference between this version and the last beta release of
2.61 is that 16-bit color has been redone, and seems to now work
properly. Please let me know if you have hardware on which 16-bit color
does not work. I also included a deskjet 550c driver, which was
requested by several users.

Atari GS 2.61 now has a true GEM interface, although the text window is
a bit slow and still has a quirk or two. I will try to improve these
things in later releases. This code is not as polished or as organized
as I would like, but I haven't had alot of free time lately. GemGS (a
gem shell for GS) has not been updated to work seamlessly with GS 2.61,
but gemGS 1.3 should be usable if you disable the "windows" option
(within gemGS).

GS 3.0 is estimated to arrive in about 5 weeks, at which time I will
begin work on that. It is supposed to have full level 2 support.

Message-ID: <2h7hfm$j8j@u.cc.utah.edu>
Source record: 194953

I have a few questions about higher speed modems. I have seen both Zyxel and U.S. Robotics selling modems in 16.8k and 19.2k bps modulation, but are these compatible with each other? That is, could a USR and Zyxel be connected to each other at 16.8k or 19.2k? If so, does this mean Zyxel modems use HST? And what does HST stand for? Also another question, about the new USR v.32 Terbo that connects at 21.6k, is Terbo another USR proprietary modulation? And what is going to be the official V.FAST speed? 34k? (Since Hayes and Rockwell have come up with their own 28.8k standard) Sorry to ask stupid questions but I'm more than a little confused. Not that I'm going to buy any of these, but I'm curious.

991. GEMBench 3.40

Newsgroup: comp.sys.atari.st
Date: 1994-01-15 02:40:36 UTC
From: ogal@cix.compulink.co.uk
Message-ID: <CJnGro.CFJ@cix.compulink.co.uk>
Source record: 194983

I have just uploaded GEMBench v3.40 to ftp.tu-clausthal.de

Rather than bore you with details, I'll just say that this version has
many new features and I have also fixed the save and print bug of v3.30.

I have already started work on v4.00 which will make GEMBench a truely
unique benchmarking system for TOS computers.

Ofir ogal@cix.compulink.co.uk

992. XControl (was Re: Calculator Accessory???)

Hmm... maybe I need a new XControl, I find the thing to be so buggy,
it bombs a lot when I exit it.
Are there different versions of it? Does anyone else have problems
with it?

Craig.

No fan == bad idea.

However, there is an easier way. Simply purchase a high quality fan ("high quality" for a fan means "quiet"). You can find wafer fans for $5-$20. The more money you pay, the quieter they get. The first fan I had in my unit was loud as hell. When I called the company to return it, they hastily Fed-Ex'ed me a different (more expensive) fan. I stuck it in, and have no complaints. I was amazed at the difference. I could tell the new fan was a much better unit just from looking at it (epoxy filled motor cavity, precise mold lines, etc.). Unfortunately, I cannot remember the name of the fan manufacturer. Hope this helps.

>>> Does anyone here have an internet email address for Darek Mihoka
>>>or BRA Software?
>>>
>>> Also, is anyone here currently using the GEMulator? I'd like some
>>>genuine product info...

I'd like to thank John and Greg for answering Kevin's questions while
I was away over the holidays. A couple of things that were said need some
further clarification since Gemulator 3.02 (which is the currently shipping
version) has some improvements that are not documented in the ads and
newsletter.

By the way, before I get a bunch of mail from 3.0 users saying "what's this
about 3.02", upgrade notices have just been dropped in the mail that give
all the details. As this is a maintenance upgrade it is _extremely_ cheap
if you already own Gemulator 3.00.

First of all, Kevin asked about memory consumption. Gemulator 3.02 uses
almost 1 megabyte LESS memory than Gemulator 3.00. In other words, given
the same setup, Gemulator 3.02 leaves a meg of memory left over, so you
don't have to strip everything out of your CONFIG.SYS file and AUTOEXEC.BAT
file if you were low on memory before.

Similarly, whereas Gemulator previously required a PC with a minimum of
4 megabytes of RAM, it now only requires a 3 megabyte PC. You get all the
speed of Gemulator 3.00, it just takes a lot less memory.

Second, Gemulator 3.02 does not require a hard drive. The whole executable
program fits on and runs from a 720K floppy, so it can be used now on PCs
that have no hard disk whatsoever.

Thus the minimum memory hardware requirements for running Gemulator are
now simply: 386/486 based PC, 720K or 1.44 M floppy disk, 3 meg RAM, VGA card.

Third, for people that do use the hard disk, Gemulator 3.02 now gives you
access to all DOS partitions smaller than 32 megabytes. Gemulator 3.00 was
limited to accessing drives C: D: E: and F: only. So if you have a really
big hard disk and had tons of partitions past F:, Gemulator can now access
them.

Also, the HDX hard disk driver can now be installed on and autobooted from
any of the DOS partitions other than C:. You do not need to use a virtual

drive any more if you want autobooting.

There are several other bug fixes in 3.02 that are described in the upgrade notice, so feel free to call me at 206-369-5513 weekday mornings if you need clarification on anything or you want to upgrade.

Or, you can buy from any other store in the contry for the list price
of $250 (Like the Good Guys in calif, or order through your local
Babbages).

Perhaps, I would guess list on this to be about $20 lower as well.

Just a warning to others - attenuators did nothing for me, I tried
everything from rolling my own to buying Radio Shack ones. The only
thing that worked on my Falcon was the Magical Ground Loop Isolator,
availiable at you local Radio Shack for a mere $10.

With it, I just sampled about 52MB worth of Star Wars, Empire Strikes
Back, and Return Of The Jedi AVR clips in wonderful 25MHZ 16-bit stereo
sound. Now, I just have to whittle them down a bit, buy 16MB of
memory, then perhaps I can use a few as system sounds.

The CPU is a 4 MHz 6502. It's the graphics processor that it 16 bit. RJ Mical stated that the reason that the Lynx has a 6502 and not a 68000 as CPU is that the 68000 wouldn't be very much faster, but the amount of code needed would be about three times as large.

You made me curious, so I did the test. My USR 14K4 dual standard modem does connect at V.32bis (14400 bps) even if I set the RS232 baudrate as low as 1200.

The only reason I can see for a modem to drop back to the RS232 speed, is when the modem connection does not use any protocol, since then data would be lost constantly. Anything else is IMO a bug in the ROM's, and should be reported to the manufacturer.

> Even
> if it would work, it would be a waste to get a modem that is faster
> than the computers serial port.

The serial port is easily upgraded, and according to the HSMOD1 and HSMODA (by Harun Scheutzow (?sp)) documentation even an *8MHz* ST is capable of flawlessly receiving data at 57600 bps. Or you might at some point decide to upgrade to a Falcon or TT, which are capable of handling 76800 bps (and probly more) without any hardware modification or special drivers.

> I would much rather suggest to just give c.s.a.st a broader title i.e.

If you look at the .st part of the name as a reference to a line of computer models, than the current name describes the contents quite well. IMO the ST, MegaST, STe, MegaSTe, TT030 and Falcon030 all belong to the same line, the MSDOS compatibles that Atari once produced do *not* fit in that same line (completely different hardware and os).

If it turns out to be necessary to split c.s.a.st (I don't think it is yet) I would not wanna see a system based split, but rather...

comp.sys.atari.st.misc
comp.sys.atari.st.games
comp.sys.atari.st.hardware
comp.sys.atari.st.programmer

...or something along that line.

Well, after many years of faithful service, my internal floppy drive on my Mega has finally bit the big one (could this be due to all that aluminum foil I had wrapped around it to shield it enough for the Spectre GCR to work? Nahhh!-)

I need to replace it with a drive that is known to be Spectre GCR compatible, I understand some are not. Please suggest any brands you know of and any modifications that are necessary to make them work properly. I would prefer not to modify the case, but won't balk if it is necessary.

Thanks for any advice you may have!

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's 'Statistics of Deadly Quarrels'. You've probably never heard of it even though its relevance to the mess you're in is at least as great as that of Darwin's 'On the Origin of Species,' which you learned about in fourth grade. And that's because it's so completely terrifying only those 'experts' who are adequately armoured with preconceived contrary ideas which will enable them to disregard Richardson's work completely ever get to study it."

The first limitied batch has already gone AFAIK, about 80 were sold in an HMV London store. AIUI all the rest are gone, which is a shame because a friend of mine wanted to get one.

As for the proper full scale (if there is such a thing when talking about Atari ;-) release is March 15th IIRC.

From a message yesterday I read the game Cybermorph is good but not that good, ie. poor use of colour, not very gripping.

The jaguar boot up sequence however is supposed to be pretty good, as far as boot up sequences go, lots of graphics and stuff.

Sure - but you will need a telecoms package, that is supporting the
fast features of HsModA. Currently this is Coma (Fax), GSZRZ (Z-Modem)
and CoNnect (Terminal Software).

From: amiga@hosta.dircon.co.uk
Message-ID: <amiga.758678612@hosta>
Source record: 195034

Oh calamity! GOAL! has problems with certain (new?) versions of TOS.

What happens is it crashes on some of the menus, producing error colour bars (Black, Brown, Black). This is due to the failure to allocate memory for an 'icon' (box) in the menus (about 70 bytes). This is even when there is 1/2 MB left!

Research revealed that it is not the memory that has run out, but that TOS can only handle a certain number of memory allocations (my guess is about 300). I beleive the limit was higher for other versions of TOS. The menu system probably needs 400.

The question is, is there a way round this? Is it possible to reconfigure the memory allocation system? Or do I have to work around the problem by rewriting parts of my code?

Anyway, an update of the ST version should become available when this and some other problems have been sorted out. I will keep you informed here.

Meanwhile, any help with the above problem would be appreciated.

TIA,

Dino Dini

The other problem I have is with lines that are too long, for instance when
some people quote and it overwraps
horribly.

My InterNet/UseNet feed comes through my point system (from a BBS), my msg
editor will only display 76 columns due to the right hand scoll bar (without
wrapping), so for instance your .sig wraps horribly.

It would help if people kept their text to <76 columns, although I guess this
is my problem rather than yours and doesn't exactly cost me anything, just
looks worse. ;-)

I have been a longtime subscriber to Current Notes here in the states, and
find it invaluable. It is a great magazine, and IMHO every US ST'er should
have a subscription. I cannot count the times I have responded to "where can
I buy this" posts by simply looking at the ads in the latest Current Notes.
Ditto for "where can I get my Atari XXX fixed" posts. They maintain an
excellent PD library, and publish good articles. A large portion of each
issue consists of product reviews. This magazine does not have a "everything
is rosy" attitude toward reviews. If a product sucks, the review says so.
This kind of honesty is refreshing in a computer magazine. Finally, Dave
Small (Spectre Mac emulator, SST 680x0 upgrade) is a regular columnist.

So, if you want to keep up with ST stuff, get Current Notes. A year
subscription is $27. The address is:

CN Subscriptions
122 N. Johnson Rd.
Sterling, VA 20164
(703)450-4761

If you would like to see a sample issue, I'm sure Toad computers would sell
you one for the regular cover price plus postage. Their number is
1-800-448-TOAD. So, exercise your credit card and check out an issue.

I have no connection with CN, other than as a satisfied customer.

If you have the knowledge to write such a program, then you surely have the knowledge to build mint from the sources. Maybe you simply lack the processing speed and disk space. As I see it, this is the real problem with building mint on an st, and why I would never attempt it.

1024. Eastern Iowa Computer Fair

Newsgroup: comp.sys.atari.st
Date: 1994-01-16 01:39:40 UTC
From: leland@ins.infonet.net
Message-ID: <2ha5ss$4m1@insosf1.infonet.net>
Source record: 195032

On Saturday March 5, 1994 the Commo-Hawk Computer Users Group of Cedar Rapids, Iowa will hold our eleventh (11) annual Eastern Iowa Computer Fair. We try to include all brands of computers and we invite other computer users groups to participate. Attendance has averaged around 1200 the last few years. We will be giving away a laser printer as a door prize; we are also hoping to receive other computer related items as donations to also be given away as door prizes, as we have in past years. That comes to one of the purposes of this posting.

I'd very much request a reply from you for any of the following reasons:

1) If you know of a vendor of computer related products or a computer users group that would like to receive registration information for the fair, please send me the organization name, address, and a contact person.

2) If you know of a company which develops or sells computer related products that would be interested in either donating merchandise for use as door prizes, and/or in supplying catalogs or product literature for distribution to those attending the fair please send me the company name, address, and a contact person.

3) If you would like me to e-mail to you a PostScript file (139K) containing a poster for the Eastern Iowa Computer Fair (which includes a map of how to get to the fair) send me e-mail and let me know.

4) If you would like to attend the fair and need more information about when and where it is.

You can reply or request more information any of the following ways:

E-mail: leland@ins.infonet.net
FAX: 319-363-7890 (anytime)
Phone: 319-365-9627 (evening) Leland Hosford (please before 10:30 PM central)
Phone: 319-393-5123 (evening) Greg Dengler (please before 10:30 PM central)

Eastern Iowa Computer Fair: 8 AM - 6 PM Saturday March 5, 1994
at the IBEW Hall, 1211 Wiley Blvd. SW, Cedar Rapids, Iowa
sponsored by the Commo-Hawk Computer Users Group of Cedar Rapids

Thanks.

1033. AdSCSI+ and hard drives followup

Newsgroup: comp.sys.atari.st
Date: 1994-01-16 05:14:17 UTC
From: hwl0978@gemini.tntech.edu
Message-ID: <2haif9$n71@sol.ctr.columbia.edu>
Source record: 194995

I'd like to thank everyone who responded to my query about the use of hard drives with an AdSCSI+ adapter. At the advice of one person, I called ICD and spoke to them about it.

There appears to be some confusion here about the type of drives that will work with this adapter. The guy told me that the AdSCSI+ and AdSCSI ST can work with parity on OR off. The Link, AdSCSI Micro, and the older ICD Host Adapters were the only ones that required the parity to be turned off. This should open up the entire range of SCSI drives (except wide SCSI) to be used with the AdSCSI+.

I haven't gotten my drive yet, so I can't confirm this, but this was what I was told.

>have a subscription. I cannot count the times I have responded to "where can

I actually hate Current Notes. I know not many people are in the same boat as me, but I have my reasons. I subscribed for a year or two about two to three years ago.

First of all, there was information in the magazine that was just flat-out wrong. I knew that these claims were incorrect because I knew better from reading exchanges and information distributed on GEnie. I could not believe that a magazine would print incorrect information and pass it along as news. Unfortunately, I don't have examples of this, but the info was usually in the columnists' articles in the beginning of the magazine. Dave Troy's articles were usually very good, but alone, they were not worth subscribing to the magazine. Dave Small likes to ramble.

Secondly, many of the reviews were very short because the reviewers were not compensated. The reviews were also not very good because many of the authors had never written before: "I just got this great program and I want to tell you about it. I went to my Atari dealer, said hi, asked him how his dog was doing.... " Yeah, right; I pay money to read this. Sometimes, the reviews were less than a page. Most of the time, the reviews were quite incomplete.

Finally (and I offered to fix this problem but was refused), I could regularly find blatant misspellings and grammatical errors. It really hurts to pay for a magazine only to find that its publisher and "editor" don't take pride in it. They don't even run it through a spellchecker. Quality is a problem with ST Informer also. 'Lets just get some words between a few advertisements and people will love us and send us money.'

I refuse to pay money for this garbage. People are better off with a GEnie or Internet account.

My $1.47...

1037. 800XL video cable...

Newsgroup: comp.sys.atari.st
Date: 1994-01-16 06:46:19 UTC
From: Rafael.Figueroa@bilbo.strydr.com
Message-ID: <3013@strydr.strydr.com>
Source record: 194806

Dear Netters:

A friend of mine needs some help finding a video cable (composite RCA-
Atari -> monitor[no details given].)

Any ideas of where he may find these(catalogs?)
Another question, does anybody have any info as to where to find
software (either on disk or cartridges) for the 800XL? new or used?

Please, I do not follow this forum: all responses should be addressed
to me.

Thank you very much,

Rafael Figueroa

Ofir, since you do have the new version and docs, perhaps you could answer
a question for me. Or anyone who is reading this can certainly respond.
In the docs, more specifically MFP_X.TXT, it first states that MFP.PRG cannot
increase an 8-MHz ST to more than 19.2k without hardware modification. But
later on it says 57.6k is achievable on an 8MHz ST by turning on the
FASTINT switch in MFP.PRG. Did I miss something?

Is anyone familiar with the batch of falcons with the bad analog audio
in/outputs? we have a couple of buzzards here that have t
this problem and need some information on what if anything can be done about
repairing this. Specifically the left output and right input
is nonexistant. Atari claims something to do with a capacitor but won't say
more than that.
Bias on bad output channel is way off. Have not checked bias on input though.

Mag!x has a built-in desktop, nothing fancy. You can install a replacement
desktop (Gemini) if you like. It runs TOS programs in a window and
multi-tasking TOS programs is no problem. No need for MiNT.

Ofir ogal@cix.compulink.co.uk

1053. Which DESKPIC ?

Newsgroup: comp.sys.atari.st

Hi there,

A few days ago I read (in this group) that the auto folder program DESKPIC is resolution independent, and supports the GIF and (X)IMG formats. Archie found me deskpic.zoo at ftp.germany.eunet.de, but it turns out this is an old version (july 1992) that only supports Degas pics in ST-Mono, which I don't have (neither the pics nor the resolution).

What is the current version of Deskpic? Under what name do I find it?

Regards,
Waldi (walra%moacs11@nl.net)

I don't think it's possible to change it to more than 19.2 with just
software. However, hsmodem does improvce transfer speed. I guess the
person to ask is Harun himself.

If I recall correctly from the thread that was here about 3 months ago, 2mb simms were for use in IBM PS/2 systems or something similar. They were pretty much useless to other machines though - most like only 256k, 1mb, 4mb and 16mb simms.

Karl.

I await to be corrected - no doubt I'm hopelessly wrong.

Marty,

I'm not that familiar with Jampack but I have used ST-ZIP alot... I need to send the guy a postcard for sure. Anyways... You _CAN_ multitask with ST-ZIP just fine... it's just that whenever you start extracting or compressing something, it is a CPU hog. Considering the fact that everyone wants the fastest ST-ZIP possible, I can see why it is. Since GENEVA is co-operative multi-tasking, there's not much you can do to change the way ST-ZIP works. About the only thing I can suggest is that you get ahold of MiNT or MultiTOS and run the CLI based version of ST-ZIP (called STZIPJR.TTP?) with a low priority. Geneva is designed to multi-task GEM programs and it does so !_VERY_! well... it's just that there hasn't been much new in the way of changes to the disk I/O... not really much of a way of forcing it into the background.

TYL, Scott

1068. AHDI 6.05c and HDX 5.03c - Safe with Mega STe?

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 00:09:14 UTC
From: vij@vnet.ibm.com
Message-ID: <2hckva$13vp@tornews.torolab.ibm.com>
Source record: 195031

Hi All,

I just downloaded HDX 5.03c and AHDI 6.05c from a local BBS.
The readme files doesn't say much, but the only machine
it mentions is the Falcon. I've got a Mega STe, so I'm
wondering if this new HD driver and utilities will be
ok on it. I'm currently using AHDI 5.00

Any Mega Ste owners use AHDI 6.05c? Also, the readme didn't
really say much about what's better in this new version.
Anyone have any info>?

Thanks in advance...

VIJ...

> Can anyone direct me to a good version of Unix for an Atari ST, either

> I understand that there are several versions of Unix available for the
>ST, but I have only seen Minix.

The ones I know of are Minix (several main versions and plenty of
varients), OS/9, Miriage.

None of them are well suported and none of them are free. That also goes
for the 'genuine' Atari UNIX which was also available for the TT.

IMHO your best bet is MultiTOS. MTOS is based on the MiNT kernel which is
very BSD Unix like (as far as it goes). Of course there is alot missing,
but then an ST is hardly the best basis for a UNIX workstation. ;-)

Actually you can get away with just MiNT which *is* freeware. You need a
decent shell though. ksh and tcsh varients are both available in the PD
and do a very good impression of UNIX when run over MiNT. This combo (
or full blown MTOS) also have the advantage of running TOS programs which
none of the other UNIX clones do.

Regardless, 4Mb and a hard disk are essential for any sort of serious work
with this sort of software.

:-)

Roland.

Date: 1994-01-17 04:13:30 UTC
From: Graham.Irvine@mettav.royle.org
Message-ID: <758780102.3@mettav.royle>
Source record: 194761

It was none other than Steve Taylor that wrote on the 10 Jan 94 that ,
ST> No-one has enough hard-drive space, however much they buy, IMHO.
ST> Datalite is a more 'current' program, doing much the same job as DC
ST> Data Diet. I can't remember where it comes from, but it is sold by
ST> HiSoft in the UK. Very reliable from what I am told, and costing I
ST> think, around 40 UKP, last time I heard.

Yes ,I have it running flawlessly here but to say that it slow's the
i/o on a standard ST is a bit of an understatement , I have confined
it to one partition I use to keep new or seldom used stuff on. It does
however give me a 194% of previous space.Other trade off's are that it
does use a fair bit of memory although you can 'disable' it (You can't
access the compressed Drives) and it doesn't compensate for the 16M limit
of pre 1.4 TOS's.

I beleive it is a bit more useable on faster machines .

author's are Logilex GmbH (Bonn) but distribution is through HiSoft/Oregon.

1076. help needed with 1.0 - 1.4 upgrade

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 04:58:34 UTC
From: rge@helix.nih.gov
Message-ID: <1994Jan17.045834.9258@alw.nih.gov>
Source record: 195033

I broke down and ordered the (expensive, $60!!) TOS 1.4 ROM upgrade chips for my old ST. TOAD sent the chips, but didn't send any instructions for which chip goes where. I finally figured out how to open the case and found what must be the 6 ROM chips. They sit under the power supply, right?

There are two rows, with the sockets labeled on the board as follows:

U4 U7
U3 U6
U2 U5

the actual chip labels are:

c026162-001 c026165-001
c026161-001 c026164-001
c026160-001 c026163-001

The new (1.4) chips are labeled: C3006xx-002A, with 'xx' ranging from 35-40

I assume the placement should be:

C300637-002A C300640-002A
C300636-002A C300639-002A
C300635-002A C300638-002A

Can someone tell me whether this is correct, before I resort to trial and error? Thanks much.

1077. SPICE - corrupt/missing PRL

1081. Mega STE/1

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 08:12:46 UTC
From: lonsdale@acri.fr
Message-ID: <1994Jan17.081246.26102@acri.fr>
Source record: 194931

I am thinking of buying a Mega STE/1 which I have seen
for what I think is a very favourable price. I have had
an STFM (2.5MByte) for three years now, so I am fairly
familiar with it.

What I need to know is what advantages are there in the
Mega, and are there any problems with it.

More specifically, is there a space for a hard drive in the
Mega case, and is this supposed to be a SCSI drive. I already
have a home built drive, and most of the reason for wanting
the mega is to get it all in one box.

Thanks in advance.
Andrew

Hermes would have to be the best available.
It's shareware. Unfortunatly about 70% (??) of the docs are still in
German, but with the help of the net, and a bit of patience, it's
not hard to get going in the right direction.

Duplicate articles appeared in comp.sys.atari.8bit, comp.sys.atari.st, and comp.sys.atari.st.tech with an additional header tacked onto them stating that they were from CRS Online. I'm sure if you check one of the public access usenet sites (LaUNCpad, etc.) you will see one of these articles. They may not have appeared on your system, but the rest of us out here saw them. The extra header is probably what kept them from being killed as duplicates. It also appears that all of the articles reposted were nearly a week old by the time they were reposted.

>of the STF (meaning that you won't be able to use all of the modems

Unless I misunderstand the documentation, HSMODEM and its successor HSMODA02 (the latest I have seen) will allow 57600 on a standard unmodified 8MHz ST by changing the interrupts around. There is also a hardware modification mentioned in the docs that will allow 115200. The docs were only partially translated by the author, so that is why I am somewhat unsure. Also, I olny have a 2400 w/v.42, so 9600 is my max speed, so I have no way of checking 57600.

Interesting. Sounds like the Falcon Beta I have. What is the version of the cover
disk one?

|> The question is, is there a way round this?

Yes, never use Malloc directly, only through some memory management
functions, like malloc in C. Especially when using memory protection
under MiNT, Malloc is slow, because the protection tables have to be
updated. In general, trapping to the OS should always be avoided as
much as possible.

There was a German package a few years back that ran ST software under X. I can't remembe rthe name though :-(

>know how to convert other stores of fonts to Calligraphy font files?

>My postscript printer has a lot of fonts but I can only access a few
>at a time using the postscript driver pak.
Well, I did warn you before you bought Calligrapher! It can only access fonts built into your printer if it has the corresponding vector font for drawing on the screen (and non-PostScript printers). Hence, you are practically limited to the `standard' Level 1 font set (ie 4 x Times, 4 x Helv, 4 x Courier, Symbol, Dingbats). [Actually, I'm not sure that it has all variations of Courier].

As for PD fonts, these are unlikely, as the format was never published. When I asked Working Title for the font format, they told me to f-off.

I don't know if they're still trading, but Gate Seven Computers used to sell Calligrapher fonts and others. They used to advertise in ST Apps, I'll try to find a phone number if you like. Remember, though: As I said before, these fonts will be rendered *very* inefficiently (both in terms of file size and print speed) by the Calligrapher's PostScript driver. It does not download them as PostScript fonts, but draws each instance of each character individually, using straight lines and fills. This makes files extremely large, and bypasses the character cache mechanism in the printer.

For all practical purposes, if using PostScript, you're stuck with with the basic font set.

One final tip: Like many other people, I find PostScript Courier to be too light. Therefore, I set the Calligrapher font map so that the Calligrapher Unitype font was mapped onto PostScript Courier-Bold. This gives a heavier face without compromising spacing (because Courier is fixed spacing).

>multitasking..
That's because Geneva is a *co-operative* system, not pre-emptive (eg if
StZip spends some time processing a file, and does not call the AES, then
other programs don't get a look-in). MultiTOS will do what you want.

Well, you could always make your postings more brief by cutting your
.sig file down to a more reasonable size :-) (Netiquette guides usually
suggest a four line max. The whole world does not really need to know
how many Megs of RAM you've got in your Falcon, especially as you can't use
two of them!).

Eh? If you can compile MiNT, then you can compile a MultiTOS kernel. Just
compile with -DMULTITOS and without -DONLY030 and -DDEBUG_INFO.
(This info is from Eric Smith).

>The problem with your request is that although many people agree with it,
>nobody wants to stick their neck out and publically break one of Atari's
>conditions.
Well, if you break their conditions of free distribution, then you shouldn't
be surprised if they take away that free dist. (Unfortunately, the
arrival of the Jaguar seems to have frozen TOS/MiNT development anyways).

1098. cross compiles/link from Sun3 to ST?

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 11:37:00 UTC
From: censjg@caledonia.hw.ac.uk
Message-ID: <1994Jan17.113700.11293@cee.hw.ac.uk>
Source record: 194915

Subject says it all really.

I have both Sun3 & Atari at home, Sun has nicer (more familiar)
development environment, I know gcc (up to gcc 2.4.2 ??) can be used
as a cross compiler, but.....

Do I need to use gas or will as produce sensible m/c (I guess as is ok) &
can anyone comment on cross linking, ie I'd like to have gcc & atari libs
etc all on the Sun & be able to compile & link on that machine then
transfer the resulting executable to the ST(, maybe even run gdb over the
ST's serial port to the Sun...).

Any comments regarding this (especially from anyone who's tried it and
succeeded/failed :) welcome, email preferred.

Thanks,

1100. Atari Database using ASCII

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 12:22:27 UTC
From: Markus_Schlegel@bn.maus.de
Message-ID: <P35764@BN.maus.de>
Source record: 194912

Hello everyone!

I would like to use the Atari as a Database-server with a simple
BBS-Program,
working from a shell that will only accept keyboard-inputs.

My question: Is there a database system (relational) for the atari that
will
exclusively use ASCII for display and will accept commands exclusively as
ASCII-keyboard-inputs?

If so, please e-mail me.

Many thanks
Markus Schlegel

You misunderstand the documentation. Harun explicitly states that any
rate above 19200 needs a hardware modification which hsmodem then will
support.

Does anybody out there, with enough german-language knowledge knows
details about this project of C't magazine, thats to say, putting
a 68030/33 Mhz proseccor on an Atari. The major things Iwould like
to know is, since I have a copy of the magazine, but can't read it,
does this board fits on a STE with a square 68000 chip ? since my
4096STe has a square socket. Also do Ihave to purchase also a German
version of Tos 2.06(with patches included...) form the same source ?
That means dealing with german operating system in the rest of my life ..
Thats for a start,
Thank you
Giorgos

1104. Questions from a new Falcon owner

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 12:57:57 UTC
From: csulw@csv.warwick.ac.uk
Message-ID: <2he20l$85d@parsley.csv.warwick.ac.uk>
Source record: 194916
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello everyone!

I got my falcon last week (yeah!), and in the few days that I have had it
I have come across a number of 'oddities' that I need help on.
I have a falcon 4/127, TOS 4.04 and MTOS 1.04.

1. The manual says you can run .CPX and .ACC files from the desktop. I can't
seem to get it to work, with or without MTOS.

2. When I use the MTOS CPX to turn on memory protection, I get a 'memory
protection error. Adjust debug level...'. Why does this happen, and what does
the error actually mean?

3. When setting Compatability video modes, I sometimes get TT modes greyed
out as well.

4. Where can I find a file telling me what environment variables to
set up for GCC, and what file do I put them in. I tried GEM.CNF, but
I was not sure of the names of the variables.

Help on any of the above would be really appreciated.
Thanks,
Paul

I'm not a hardware expert, but that sounds like an awfully ridiculous
way for something to be done (of course, I've seen many ridiculous
things in my life :-) However, I doubt that is the case. A CDROM should
be handled awful similar to a disk drive, hard disk, cassette deck, or any
other such media...

It's not quite compatible with MiNT yet (should be in one of the next
releases I'd imagine). Technically, you can load them together, but
there's enough problems that it's virtually incompatible for the
moment... (I tried :-)

Source record: 194929

Hi all. I just carried out the modification to my SM124 to increase the visible screen area. It was all pretty straightforward, but I couldn't locate the magnets to center the picture properly; could someone give me a description of what they look like and how to find them? I don't really feel like guessing with high voltages. ;)

As an aside; since the Overscan mod works by filling out to the edges of the screen, why can't you shrink (physically) the size of the screen using the above methods, and then overscan it to something silly like 1280 by 960? Sounds kind of fun (if a little difficult to read) to me... is there any reason it couldn't be done? TIA...

You need to set up some libraries before you run SPICE. When I downloaded
SPICE from atari.archive, it came with PRL.TOS which has to be run first
to setup the afore mentioned libraries.

If you have any difficulty getting this file then Email me. It was from
a bulletin board so it must be in the public domain (!!).

FYI, I tried a simple simulation which took approx 1 minute on the ST, when
I ran the same sim. at work on the VAX it took 2 seconds.

Good Luck

So where can we found a benchmark program that works on TTs and Falcons...

Can't the AES just forget some low-priority message, just like the Mac equivalent of the AES does? Forgetting a message is of course not as bad as just getting jammed. If you experience lost messages you would always have already experienced serious performance problems I think.

Erlend.

From the top of my head:

The square 68k needs an adapter socket to connect to the PAK. The
PAK pcb assumes a DIL 68K cpu.

Don't know about the STe question.

1119. MiNT Remote Login

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 16:08:31 UTC
From: cleaves@ctron.com
Message-ID: <2hed5vINNat@dur-news.ctron.com>
Source record: 194683

Hello,

I've just instaleld MiNT 0.95 from the Distribu Kit and I am trying
to get the modem to answer for remote logins. I have the ttytab entry for
/dev/ttya and the getty process is running. However, with my Supra 2400
plugged into the serial port and MiNT running in multiuser mode, all I get
is the SD and RD lights on my modem blinking. It is clear that the getty
process is responsible for this, as it stops if I kill the process and slows
down when I run other programs. I have tried setting Auto Answer and this
does not make a difference, the phone rings and the modem just sits there.
I have noticed that the Terminal Ready light is not lit, which I am guessing
is the real problem. Anyone have this working that could tell me what their
setup is?
Also, anyone use MGR? If not, is it possible to run in MultiUser
mode so people can login in under GEM and TOSWIN? From what I've seen so far,
I prefer TOSWIN, but I haven't been able to get any of the MGR programs to run,
they are backgrounded immediately.

Thanks,

Stephan

p.s. Please reply via mail, I don't often read news.

Its very odd , the places that do stock it seem to sell out within days,
the WH Smith in Bath sold all the copies of the Christmas issue in 2 days.
So why don't more newsagents stock it? It's a superb magazine I hope it
survives.Does anyone know what the current circulation is , I guess it must
be arround the 30,000 mark.ST Doormat seems to be losing readers by the
bucket load .Mind you it does have a very negitive attitude and its crap.

Long live ST Review!

Its a shame few newsagents stock ST Review. I'd but it but I never see it (only ST Format for months). And I have a quasi-religious objection to subscribing to these mags...

The few issues of ST Review I have seen have been full of the sort of things I like (ie hard technical info) and short on all the games crap etc.

Actually I hardly ever buy ATari mags nowadays...

There's been very little talk about Mag!X, compared to eg. Geneva, or maybe I have just missed it all. So tell me, has there been any GEnie conferences etc. where Mag!X would have been discussed more specificly? From the messages on this newsgroup I have got the impression that one would have to use either the desktop that comes with Mag!X or Gemini, is that true or could I use any other desktop as well?

Thanks in advance!

Tracy,

This is Gary Bergmann, and I still have my Atari system
for sale.

My mail was forwarded...and your address was stripped out...

If you could please mail a reply to me at

gbergman@datap.ca

Gary.

1132. Atari ST for sale (again)

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 18:51:28 UTC
From: cfuhrman@csugrad.cs.vt.edu
Message-ID: <2hemng$lol@csugrad.cs.vt.edu>
Source record: 194940

I am, yet again, trying to sell my Atari so I can upgrade to an
STe. Since I haven't had much response selling it locally in the
Washington DC metropolitan area I am now willing to sell it to anyone
willing to pay for shipping. Please respond by e-mail or leave a message
at (703) 951-2238 (number of my new apartment) if you're interested.

For Sale:

Atari 520STfm computer
8MHz 68000 Processor
DD (720K) floppy drive (internal)
512K Ram
Tos 1.0 (possibly 1.4. I'm not sure)

Some Current Notes disks that I'm willing to throw in:

Stwriter V1.07 (July 1986)
MicroEmacs V3.10
Pile Up V3.0 (Tetris clone)

These two are on the same disk:
Time Bandits
Joust (my brother would play this one endlessly!)

History:

This computer was origonally purchased used from L&Y Electronics in
Woodbridge, Va in May 1989. The keyboard was replaced in Fall 1991 after
it was accidently smashed and the power supply was replaced in Summer 1992
after the origonal one burnt out. Thus far, we have had no problems with
this computer (aside from lack of memory to run software and lack of
software period :-)

Best Offer gets the computer.

Some software that I'm also selling:

PC Ditto 8086 (or is it 8088?) emulator $20
Ultima V "Warriors of Destiny" $10
Times of Lore (requires joystick) $10
Checkmate (Chess program) $10

Note:

Because I ran out of room in the truck, I couldn't take the Atari down
to Blacksburg with me. I *am* planning to take a trip back up to Woodbridge
to pick up the Atari (along with some other items I couldn't pack) next
weekend (Jan 22-3).

I think he meant that HSmodem's routines are fast enough to feed a modified
port at 57600 bps on an 8Mhz machine ..

When I modified my STE to do 38400, I had to get a 16Mhz/Cache accelerator too
for it to work .. sounds like the various "HS-Fixes" has been improved .. ;)

>Can't the AES just forget some low-priority message, just like the Mac
>equivalent of the AES does?

No, it can't because Apple sues the hell out of anyone and
anything that does anything "just like the Mac"...

>Forgetting a message is of course not as bad as
>just getting jammed.

This certainly doesn't hold for all kinds of messages. Of course,
throwing away redraw messages, or others indicating user actions
on windows may not cause any serious dangers. But forgetting
AC_CLOSE messages may well cause the system to become unstable.
Hmmm... I just read that appl_read() takes an ap_id argument,
indicating the ID of the application from whose message buffer
one wants to read. Perhaps this could be exploited to write an
accessory that empties another application's message buffer. The
question would be, however, how such an accessory could be
activated when the AES are already frozen...
I think that neither forgetting messages nor getting jammed (by
waiting for an app to read its messages when the app is put to
sleep by the AES) is a sensible way of dealing with a full
internal buffer for messages. The AES should try to allocate
more memory for the internal message buffer, and display an alert
box to the user in case this fails.

Replacing 'st' with 'tos' in the newsgroup names may be
appropriate, as this would indicate more clearly that the groups
are for all Atari computers running under TOS, not only STs. But
it would not help with focussing on different issues. I'd like to
see the Atari groups organized a bit like those on other systems,
e.g.:

comp.sys.atari.announce
comp.sys.atari.tos
comp.sys.atari.tos.applications
comp.sys.atari.tos.programmer
comp.sys.atari.tos.tech

Geneva is a cooperative multitasking system, which means that if a program decides to be nasty and hog the system, it can do so and get away with it. You can't do anything about it except get MultiTOS or try to run MiNT with Geneva.

BTW, you can switch between applications while ST-Zip is extracting...just go up to the menu bar, and eventually ST-Zip will let you switch. I think it's between files. I'm not sure if you can extract in the background, though.

1143. Compiling Mint 1.08 !!!

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 21:28:03 UTC
From: abi@sn2.ee.umist.ac.uk
Message-ID: <1994Jan17.212803.6201@nessie.mcc.ac.uk>
Source record: 194851

Hi All,

I've read through most of the posts about compiling Mint 1.08 and I just thought I'd comment on the way I did it:-

* My setup is an Atari STE with 4Mb RAM and an 85Mb hard drive

* I've got GCC,G++, 2.45 (could have been version 2.3 something when I actually compiled Mint - can't remember exactly), mintlibs/includes patchlevel34

* Also got Bison (v1.19), GNU utils patchlevel36, an old make (well not the latest one anyway), tcsh (6.0.... something), and MultiTos (v1.04).

When I first tried to compile Mint everything was okay until I tried to use the final executable - It just kept crashing for no apparent reason. I looked in the makefile and noticed the 'prgflags' bit which I initially though was the problem (I don't have prgflags !)

I e-mailed Eric Smith to ask where to get 'prgflags' and he told me that I didn't need it and to check that I had the latest libraries and include files - which I did, and I had !!

What I didn't have was the latest version of the GNU assembler (gas). I happened to stumble across one of the 'update' files for the GNU stuff which mentioned a bug in the old version of gas that was causing problems with Mint !!!

After I downloaded gas from src.doc.ic.ac.uk I set make off, and 2hours (yes a whole TWO HOURS !) later I had a lovely working version of Mint 1.08 which has been installed in my auto folder ever since !!

(and they all lived happily ever after .... ahhhhh !)

I don't think that there *should* be any real problems with compiling Mint - it should (!?!?!?) be just a matter of typing 'make'; there shouldn't (?) really be any need for debugging.

If anyone wants a more detailed description of the setup I used for compiling Mint, then e-mail me - I don't read news that regularly and I could miss any posts.

Bye for now,

Andrew

P.S. I got all of my GNU/MiNT stuff from atari.archive.umich.edu or the mirror at src.doc.ic.ac.uk (this has been upgraded recently and is v.fast - in the UK - and can have loads of anonymous users - 300 !!!!)

The object file produced by Sun's cc and gcc on the Sun 3 architecture are
identical in format to those produced on the ST/falcon/TT by gcc. What is
different is the linker and library format, so the ST versions have to be
compiled and used. Also, you must remember that the Sun 3 is a 68020/68030
based machine, so the default is -m68020 and -m68881.

I have compiled programs on my Sun 3/80 (20MHz 68030 based), linked them and
transfered them to my TT and run them.. but it is not a recommended way of
doing things as your code can pick up the Sun include files by mistake,
which can cause bugs.

Note: I've not built a specific cross-gcc, merely created a new specs file
and set the GCC-EXEC etc env vars.

Steve

1145. New GEMini CDROM for Atari

Newsgroup: comp.sys.atari.st
Date: 1994-01-17 21:59:50 UTC
From: rab@sprite.berkeley.edu
Message-ID: <2hf1om$gd2@agate.berkeley.edu>
Source record: 194948

Walnut Creek CDROM announces the release of the GEMini CDROM for Atari Computers. The CDROM contains 616 MB, and 2872 public domain programs, shareware programs and commercial demos for the Atari ST, TT, and Falcon Computers plus a section for the Portfolio palmtop computer. It also contains text and graphics for the Lynx and Jaguar video game systems.

The GEMini CDROM is set up in a logical tree structure which simpifies seaching for and running the programs. You can find files in areas such as accessories, archives, astronomy, database, fonts, games, GNU, programming, screeen savers, virus , text editors, utilities, etc.

It includes 50 megabytes of games and entertainment software. For the desktop publisher, it contains 15 megabytes of fonts. Many programs include source code. All programs may be run directly from the CDROM so there is no need to decompress onto the hard drive in order to use the files. Each directory contains an index and a list of files to make it easier for a user to locate a file.

The disc is set up for both Atari and MSDOS BBS's. All the noncompressed files have a corresponding compressed version in the zip folder, so BBS operators can easily make thousands of Atari files available to their users. BBS formats include PCBoard, Opus, Wildcat, RBBS, Spitfire, and Maximus.

For a specific list of the software on the CDROM, you can ftp the index.txt and readme.txt files from ftp.cdrom.com: /pub/cdrom/cdroms/atari.

The GEMini CDROM for Atari was edited by Eric Tremblay and Rene Guimont.

The price is $39.95. S&H is $5 for US/Canada/Mexico, and $10 for overseas. If you live in California, please add sales tax. You can pay by cash, check, money order or Visa/MC/Amex.

Walnut Creek CDROM
1547 Palos Verdes Mall, Suite 260
Walnut Creek, CA 94596

1 800 786-9907
1 510 674-0821 FAX

orders@cdrom.com

The disc is available for FREE to anyone that has contributed any of their own work. Just email me your name, address, and the name of the program(s) that you wrote. Overseas addresses are ok.

Many of the programs on this disc are shareware, and require seperate payment to the author for continued use. This CDROM is fully guaranteed, if you are dissatisfied with this disc for any reason whatsoever, you can return it for

an exchange or refund.

Here is a list of other CDROM titles from Walnut Creek CDROM:

CICA Microsoft Windows CD-ROM - Windows PD/shareware from ftp.cica $29
Simtel MSDOS CDROM - MSDOS Shareware/PD from Simtel internet archive $29
Hobbes OS/2 CDROM - PD/Shareware from ftp-os2.cdrom.com $29
Giga-Games CDROM - Thousands of Games for MSDOS and MS Windows $39
GIFs Galore - Thousands of GIF images $39
Aminet Amiga CDROM - shareware & PD swr collection for Amiga $29
Garbo MSDOS/MAC CDROM - shareware & PD for DOS and Mac $29
Space and Astronomy CDROM - Nasa photos, doscs $39
Project Gutenberg CDROM - Hundreds of etexts, literature, documents $39
QRZ Ham Radio CDROM - Callsign database, shareware & PD, docs, etc. $29
Sprite CDROM - Sprite Research Operating System from UC Berkeley $29
Nova for NeXT CDROM - Software for NeXT (Motorola) Workstations $59
Nebula for NeXTSTEP (Intel) CDROM - Software for NeXTSTEP (Intel) $59
Source Code CD-ROM - Usenet source archives on CD-ROM $39
X11R5 and GNU CD-ROM - X11R5 Window System, Gnu Src, SPARC binaries $39
Ada CDROM -- Thousands of Ada documents and programs $39
Info-Mac CDROM -- 10000+ Mac programs from sumex-aim.stanford.edu $49
C User's Group Library CDROM - C source code $49
Libris Britannia - British shareware $69
Tookit for Linux CDROM - Linux Applications, Slackware distribution $39
FreeBSD Operating System CDROM - Complete 32 bit OS, X11R5, GNU $39
GEMini Atari CDROM - PD/Freeware for Atari $39
La Coleccion CDROM - Spanish PD/Freeware $39

CD-ROM Caddies $4.95

If you would like a more detailed list of other CDROM titles published by
Walnut Creek CDROM, you can ftp the latest list from ftp.cdrom.com
in the file /pub/cdrom/catalog, or send email to info@cdrom.com.

Well, maybe someone was looking for an OS with pre-emptive multitasking; or maybe just a good command line shell. I've found Gulam isn't bad when I just want a Unix-like command line, but it depends on uEmacs a little too much for my tastes. Is there a better command line shell for TOS, of the 'csh' flavor?

>attempt it.

The point is that it is quite possible to hack an MTOS kernel into a MiNT kernel with freely available software - no expertise needed.

Bearing this in mind Atari *can't* release an MTOS kernel without also, by implication, releasing a new MiNT kernel.

Their 'solution' seems to be to sit back and do nothing.

BTW if the little 'hack' doesn't actually modify the MTOS kernel so Atari can't even complain about integrety of binary files.

As for compiling MiNT on an ST. I'd rather not have to do it, but I can and I do. If I could compile a working *MTOS* 1.08 kernel (as opposed to a MiNT 1.08 kernel) I'd be even happier. I know it *should* be easy, but it doesn't seem to want to work for me.

:-(

Roland.

1. For arguments sake, if I was in the UK, and got a Falcon from the US, destined *for* the US, could I still use it 100% in the UK!? (With the possible exception of the (If I'm lucky) packaged Atari-works having US thesaurus/dictionary). e.g. Does the PSU autoswitch between 110V and 240V? (60/50Hz), and can they handle both PAL and NTSC video output!?

2. Same for the Jaguar. Can a US Jag' be used 100% on a UK system.

This info' is for a local dealer who wants to get the machines in cheaply, but is unsure of doing so if they won't work without replacing the PSU's!

What me, Worry!? O O Just Grin

1154. ATARI STE

Newsgroup: comp.sys.atari.st
Date: 1994-01-18 06:27:22 UTC
From: alberto@terapin.com
Message-ID: <alberto.29ge@terapin.com>
Source record: 194894

Hi everyone. I still have an ATARI 1040 STE system. I am thinking of selling it, but it seems that the price for this type of system has gone down quite a bit... too much for me to justify selling it.

I am thinking about keeping it and maybe upgrading the Ram to 4 megs, Tos to 2.06, and getting Geneva and Neodesk in hopes of having a workable system. I will soon have a 100 Meg SCSI HD, so I should be set.

I would like to know if this kind of setup could still be kept alive.. In other words, is there still software being released to be compatible with my STE? I haven't heard any news since the Falcon came out, so it seems as though ATARI died and went Jaguar from my end. If someone could please e-mail me whats going on, and if I can in fact still be productive with my system. Mainly I want to do word processing and computer programming, in C and C++. Of course I also do telecom, which I use Stalker for.

So please e-mail me some ideas, news, suggestions.

Thanks,

alberto@terapin.com

Hi you must disable the parity strap on the Quantum..

And try and format with the latest HDX XXX or what ever, I use
ICD with my system and a 240LPS Quantum...

Windcap is not used with SCSI drives....

> -DDEBUG_INFO. (This info is from Eric Smith).

Not really. MultiTOS is more than just MiNT. It comes with a new
AES and desktop... which (correct me if I'm wrong) isn't included with the
sources to MiNT. Agree or disagree?

Message-ID: <2hg9gc$4k5@percy.cs.bham.ac.uk>
Source record: 194875

Another wierd AES (or it might be WINX 2.2, I'm unsure) bug, is that it temporarily forgets a window has its BEVENT bit set...

I open windows A and B, and set their BEVENT bits.

I open window C, and don't set the BEVENT bit.

In the window C event loop, I ignore all WM_TOP messages, thus keeping the user 'locked' into this window, whilst allowing program switching via the menus etc.

So the window stack is:
A (furthest back)
B
C

I open Xcontrol, and then close it. Now window C is back on top (WM_TOPPED ?). I close window C.

Now when I click on window A, the click is ignored. But if I top window A, then window B, background clicks start working properly again.

Wierd, huh? I'm pretty sure it isn't a code error, as it only happens when I open another application's window.

>|>
>Hey I havn't even seen it in the UK for months :-)
Many newsagents seemed to stop carrying it when it was no longer SOR.
Although it's still the best UK glossy (IMO), it has many faults. eg the
review of Cubase Audio in the last issue just didn't go deep enough
for such a big, important, product. It didn't even mention things like
sound quality, accuracy of sync to external devices (and internally
between audio and MIDI tracks). And what about the from-RAM sampling
Maybe the editor chopped the important
bits out of your review, Ofir? :-)

(Actually, for the sort of info you need on something like Cubase Audio,
I guess you should go to a mag written by pro musicians, eg Sound on Sound).

ST Review is worth getting a sub to if you can't find it at the newstands.
Lots of technical stuff, reviews of hardware & apps and only minimal games
coverage. Lot's of MIDI too.

No flame intended, but it comments like that (and the implied piracy that follows) that meant that NextBase sold next to no copies of Autoroute (I'm sure I read somewhere that they only sold 30 (thirty) copies of the ST version in the UK, yet copies were to be found everywhere), and hence that they decided not to bother developing the ST version further as it wasn't viable.

To (mis)quote an ad...

"Probably the most pirated piece of software in the world"

The possible apocrophyl(sp?) story goes that the director of Nextbase was
invited back to his old school to give a lecture. While there he asked if
anyone had seen Autoroute. A huge bunch of hands appeared. He then said
'and what computer is this?' A big cry of 'Atari ST' by more people than
he had sold copies in the entire country.

I agree, if I had any trouble finding ST Review I would definitely subscribe.
Since it is published by the same people as ST User, and it's unlikely that
they will continue to support two magazines past the end of this year, they
are likely to drop the one with the lowest circulation. I'm fairly sure that
User sells better than Review at the moment, but I would prefer to see User
dropped.

Actually it could be the UNIX emulator on ST, what my friend is now working on.
The system is now stable and he had compiled straightly the tcsh and many of
the subsidiary programs (like ls,cp etc...). He is now working on porting
x-windows to his system.

I have TOS 4.01 and I never had any problems. My Falcon boots in SVGA 640x480 16 colours, superboot seems to assume this is ST High res and gives a black and white display using 640x400 of the screen. It works fine, apart from the password protection option which will cause it to fail if on. But I never saw the point in that anyway when you can prevent any auto programs from running by holding control...

You can extend the internal memory pool by running FOLDRxxx. But
the better way to get around this (documented!) limitation is to
use malloc() instead of Malloc().

1177. Geneva and MiNT and TOSWIN ?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

Ok, so there's been lots of talk about Geneva recently, two ST mags (UK) reviewed it and thought it was great for ST's - well that's how I read it anyway :-) . My question is can it multitask TOS programs as well as GEM thingies ? How about compatibility with MiNT and then using TOSWIN to run things ? I'm a little lacking in knowledge about this sort of thing really - any info. greatly appreciated.

Thanks,

Martin

The Jaguar has not yet been release in this country at any price, you American Imperialist internet running-dog type. Converting local rubles into US currency, you will find $357 is about US$ 275. Considering the merchandise is grey-market goods, not a bad mark-up.

>> Game Cartridges available now are:

List price is US $49? That's about $60 in Manitoba dollars. Again, not bad for unavailable goods.

>Please don't! Number deleted to protect the innocent.

Don't call 'cos you'd be supporting crass commercial imperialist exploitation of the collectivnet. Prices are ok, though.

What do you want to do with your STe? New stuff is still being released although much of it tends to be for 'power-users'. There is still huge amounts of tried and tested applications for pretty much all needs.

Not that they've been necessarily winning these lawsuits. Keep an
eye out for the latest version of Windows (4.0, I believe). I've seen a beta
version - it looks more like the Mac (or ST) than it's own predecessor,
Windows 3.1...

I've heard that an optimistic estimate would be 20,000 machines; not
surprising given Atari's "marketing" and "support" of the machine. And
it's relatively high price and low power.

>with Mag!X or Gemini, is that true or could I use any other desktop as
>well?

You don't *need* a desktop to use Geneva - you can simply go up to
"File" (in the Geneva manager screen) choose "Open" and run programs
from there. Neodesk is supposedly the only desktop so far where you
can *multitask FROM* the desktop (though Gemini 1.99 might be able to
as well?). You could though very easily open a desktop as one
of the tasks from Geneva...

Don't know much about Mag!x other than positive remarks from
people on the net...

This is, of course, wrong. The way CRS is munging the headers in the duplicates, dupe-checking software isn't going to notice them... as far as it's concerned, these are "new" articles.

I've already sent Richard two examples of the duplicate articles, one from "@canrem.com" and one with the From: field completely captitalized. It looks like some bozo is using a seriously buggy offline reader (probably DOS or Windows-based, no doubt).

getting cheaper and bigger.
: Why not buy a second (or better an additional) one ???

: -
: Konstantinos XONIS
: (XAKChaos of XAK-Design Wetzlar)

The answer is alwas the money :-)

Why should I buy a second HD, whenn I can get 50% more capability
of my old one using a simple (and cheap) program.

Digital Data Deicke (ddd) in Hannover/Germany supplies all their
HD for Atari with a compress PRG calles "ddd-compress".

If you buy only the program, it costs about 80 DM, I think.

Believing their ads, it renders about 50% more capability.

bye,
Martin

1189. TTTIME: bombs

Hi !

I have problems with the CPX-module TTTIME, which should correct
the internal clock. When XCONTROL starts with active TTTIME-module,
it produces four bombs and the internal clock is totally unset.
Any idea how to solve this problem ?

Greetings, Peter

grsys168@gulliver.informatik.uni-dortmund.de (Patrick Koehne) writes:
>If this company doesn't exist any longer, is it possible that someone could give
>me that programm, even when the datas are older?

Whoa, be careful there, Patrick. First of all, I'm fairly certain that the company that markets AutoRoute (or is that AutoMap?) _does_ still exist and they might not take kindly to folks giving away copies of their program. Secondly, even if a company no longer supports a product that does NOT remove their copyright protection. Many people make the same, yet still incorrect, assumption about older software.

Cheers,

Geneva is every bit as good you say the mags say it is (I haven't read any print reviews...I just went out and bought it ;-)). Geneva will run TOS programs using a program called GNVA_TOS, which works a lot like TOSWIN in that it puts the TOS program in a window, and you can chage the font, etc, etc. However, you can only multitask programs which read the keyboard regularly, so you can't stick, say, a ray-tracer in the background like you can with TOSWIN and MiNT. Text editors and term programs and suchlike should work fine, though.

Well, apart from 1000 commercial fonts... and several PD ones I've seen on BBSs
and CDROMs, no :-)

Why not get the Word Perfect pack? 50 Speedo fonts that work with Ataris for
29.95GBP and probably less in the States.

The Eagle 32 accepts TT FastRam. This means it can take 1MB x 8, 1MB x 9, 4MB x 8, or 4MB x 9 SIMMS is 2 banks of 4. It can also take 2MB x 8 or 2MB x 9 SIMMS for upgrades of 8 or 16 MEG.

The tower case I have on my Falcon is from System Solutions, part of Atari Workshop in Windsor at the Windsor Business Park. The Accelerator was bought from Gasteiner who are situated in Tottenham, just down the road from the football stadium.

I hope this text has been some help to other users out there.

Jon.

1200. LASERDEMO

Newsgroup: comp.sys.atari.st
Date: 1994-01-18 18:10:08 UTC
From: ee90jde@brunel.ac.uk
Message-ID: <CJu7sx.vG@brunel.ac.uk>
Source record: 194812

Does anybody know how to uncompress the laserdemo.tos.z file for the Falcon in src.doc.ac.ic.uk? It isn't in standard unix compress format, I've already tried to do it this way. I would be grateful if anyone could help.

Jon.

1201. TT/Falcon SCSI throughput

Newsgroup: comp.sys.atari.st
Date: 1994-01-18 18:12:00 UTC
From: Peter_Missel@m4.maus.de
Message-ID: <A63826@M4.maus.de>
Source record: 194733

Morning!

An important point I forgot to mention in the previous discussion of SCSI throughput of TT and Falcon machines:

Atari does NOT use the original NCR 5380 chip, but the compatible and faster LOGIC 5380. The latter's spec sheet quotes a 2.5x speed increase, giving an asynchronous transfer rate of up to 4 MB/s total.

So, miff@apanix.apana.org.au - who claimed the NCR chip could do no more than 1,1 MB/s - might be and probably is right.

But that's not the chip we are discussing about, although we (including me) kept talking about the "NCR chip".

My transfer rate testing had a top result of 2200 KB/s so far, which would perfectly match the "2.5x speed increase" Logic claims to have over NCR's original chip.

I apologize for being unprecise in my previous postings.

bye, Peter

1202. Help Needed (Spectre, SCSI/2, etc.)

Newsgroup: comp.sys.atari.st
Date: 1994-01-18 18:17:22 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CJu84y.30E@watserv2.uwaterloo.ca>
Source record: 194810

I have a few questions on different topics:

SPECTRE:

Has anyone tried Mac System 7.1 with Spectre 3.0? Does it work?
Is it too slow for words? I have 6.0.5 but I understand 6.0.6 and
6.0.7 are for color Macs but 6.0.8 is compatible with Spectre, is this
true? (i just bought a used Spectre recently).

As well I have an HP Laserjet 4L printer and the Deskjet 3.1 driver
on info-mac does not work properly. It does not print fonts properly
(the driver is supposed to substitute printer fonts for Mac fonts) I
assume this is because the 4L font selection is not 100% downward
compatible. I have an old Deskjet Plus that I will try this evening
(through the serial port so I can have both hooked up). Anyway, the
4L LOOKS almost identical to the Personal Laserwriter 300 that Apple
sells - it is obviously an HP printer and uses the same toner cartridge.
Has anyone tried the driver for the Personal Laserwriter 300 with a
Laserjet? I'm curious as to whether it would work.

SCSI/2

I Have an AdSCSI+ and am looking for another hard drive. It is hard
to find staight SCSI anymore, everyone sells SCSI/2. WIll this
work with my adapter?, ie. is SCSI/2 downward compatible or
do I need a LINK to even think about it?

Thanks for any help,
Sam

Source record: 194834

Another couple of alternatives to allow 'safe' binary distribution for Atari would be to either make the binary more dependent on the ROM (and hence unusable without it) or to use the ROM to unscramble a binary (e.g. distribute a scrambled archive which uses the whole ROM to unscramble it).
Steve.

Are you planning to use 1MB SIMM's? I doubt there's enough room in the case for
all 8 of them... but you're thinking of 2x4MB perhaps?

The archive HSMODA02.* seems to have at least the important parts of the
docs translated. It seems fairly simple to get going, but there are a
number of doc files to read to be able to make sense out of it.

Hello,

Anybody knows how can I to install any PC compatible HD
drive in my 520 ST (tos 1.0), I was hear about an interface
called SCSI, but I don't know how to do it.

(I'm from Chile (south america) and since 1987-8 there are
no places were to buy (or find) any hardware or software
for the STs.)

I'll be cvery gratefully if anybody can explain this to me.

to have a real Unix in your Falcon?
==========

Why not run MiNT? You can run your Unix stuff, your TOS stuff, and still have GEM! Need memory protection? MiNT has it. If you want VM then you can buy the driver. MiNT is much further along than 68K Linux and Linux is so DOS oriented they will never get the 68K version as efficient as the DOS version without a total rewrite.

Hermes UUCP is a pretty complete package that works fairly well (unless
you want to use it under MiNT). It's up to version 1.10; I think 1.03
is on atari.archive.umich.edu if you want to check it out.

Anybody out there know if FTL Games / Software Heaven, Inc., producer of Dungeon Master and Chaos Strikes Back, is still around? I've owned both games since their release and have this urge to run through DM again and then tackle CSB (which I never got around to finishing way back when). Unfortuantely, none of the three disks in the two distributions will boot anymore and I'd like to replace the disks if it's still possible.

Alternately, if anyone out there is willing to sell these games, please get in touch with me. I don't need the documentation, boxes, etc.--just bootable disks!

Many thanks...

Jeff

Does anybody know about MIDI problems with the Falcon? I talked to a friend
of mine who sees a dealer's service bulletins, and every Falcon ever made
has CPU timing problems (acc. to Atari). The problems affect the MIDI rather
adversely, and they have no fix extant. Can anybody confirm/deny this?

1220. Re: MALLOC HELP (GOAL! PROBLEMS)

Newsgroup: comp.sys.atari.st
Date: 1994-01-19 00:53:09 UTC
From: am136@FreeNet.Carleton.CA
Message-ID: <CJuqGM.C2E@freenet.carleton.ca>
Source record: 194836

In a previous article, amiga@hosta.dircon.co.uk (Dino Dini) says:
+Oh calamity! GOAL! has problems with certain (new?) versions of TOS.
+What happens is it crashes on some of the menus, producing error colour
+bars (Black, Brown, Black). This is due to the failure to allocate memory
+for an 'icon' (box) in the menus (about 70 bytes).
[..]
+Anyway, an update of the ST version should become available when this and
+some other problems have been sorted out.

I've only had the 010 error on TOS 1.6 - I couldn't get it to appear on my friend's TOS 1.2. But here are "some other problems" which were common to GOAL! running on both machines. (If it doesn't work properly on 1.2 or 1.6, precisely which versions of TOS does it work on?!)

* On 4Mb machines, the game will crash if you move the "mouse" pointer off the bottom of the screen when choosing options. It will also crash occasionally (i.e. once per game) when in auto-zoom mode, and the display zooms out. The solution is to load the game with a reset-proof ramdisk installed - 2Mb is fine. But I would quite like to see this one fixed.

* The mouse does not work, despite what it says in the manual.

* You can switch the crowd noises on or off but you will still hear crowd noises during a match.

* Right after loading the game, load another set of teams and play a cup tournament. The game will crash at the start of a match in which a human player is involved. (Dino's solution was to play a single match before the cup and this seems to work okay.)

* Play a match against one of the teams in the rightmost column on the team selection screen. Then load a team-set with only a few teams - Scotland is a good one. When you try to play a single match, the second team will have no name. If you continue at this point, the game will crash with colour-bar error 049 (black-yellow-white). The solution is not to do this. (:

* After making a substitution, the players will be wearing the wrong kit colours - one team will be in red and the other in light blue. This is fixed by pressing space twice to zoom out and back in.

* The game can bomb completely and return to the desktop. This happens most often as a result of a foul and is by far the worst of all these problems. (I was 4-0 up against my friend when he cynically brought down my centre-forward in the box, and it crashed. His comment: "Looks like we'll have to call this one abandoned." During two hours of continuous play, it happened three times - and we had disabled all the

frills, like auto-zoom, in an attempt to avoid it.)

* After kick-off (but it only seems to happen at the start of the second half of normal time or extra time) the halfway line may decide to follow the ball around. It eventually gets clipped against the side of the screen and the penalty box.

* Substitutes sometimes bring an extra ball onto the pitch with them. It stays in the middle of the screen for the rest of the match.

* Sometimes, when playing in zoomed-out mode, the tiny players are replaced by the top halves of the full-size players. This also continues for the rest of the match.

* Also in zoomed-out mode, the away team always have the same colour of shorts as the home team. It often looks ridiculous.

By the bizarre nature of some of these bugs, most of them will probably disappear when the memory allocation problems are solved. Hopefully.

But tell me, does it sound to you like this game has been "extensively tested on 1040STFMs"?

Stephen

>That's because Geneva is a *co-operative* system, not pre-emptive (eg if
>StZip spends some time processing a file, and does not call the AES, then
>other programs don't get a look-in).

Anybody see Februarys STFormat?

Page 36 'Er, What's this multi-tasking thingy, then?'

'The most common form .. is .. high speed task switching., the procesor
shares it time between two or more programs .. so each has an equal share
of the processor time .. .

This is the method Geneva uses and its called co-operative multi-tasking
.. . The other .. method is to have one program running while the other
program "sleeps" .. this is called task switching'

ST Format is just wrong in the case isn't it?

I though the whole point about co-operative mutitasking was that the each
program has to relinquish the CPU back to the O/S so that another program
could get it. Surely this is why Geneva much preferes GEM programs
to TOS ones, whereas MTOS handles both in the same way.

Also STFormat (at least in this article) don't seem to have heard of
pre-emptive multitasking, which if I'm not much mistaken is what MTOS uses.

>MultiTOS will do what you want.

I'm glad somebody has something good to say about MTOS. Geneva is *good*,
but MTOS has a lot going for it as well. They are just designed to
do slightly different things.

BTW I'm *not* trying to start an O/S flame war ;-)

:-)

>>I know what you mean. I had to compile 1.04 myself and it took a lot of
>>effort. I'm stuck on 1.08. I can compile a MiNT kernel, but not an MTOS
>>kernel.
>Eh? If you can compile MiNT, then you can compile a MultiTOS kernel. Just
>compile with -DMULTITOS and without -DONLY030 and -DDEBUG_INFO.
>(This info is from Eric Smith).

I *know* this, but I *can't* get it to *work*. I have no problems with
MiNT/MTOS 1.04. However when I use the -DMULTITOS with 1.08 I get MTOS
kernel that doesn't load the MTOS AES.

However I fully understand that it must be something I'm doing wrong, so
I'm not blaming anybody. Its just that that I can understand why people are
annoyed that versions after MiNT 0.95 and MTOS 1.04 are unavalible.

>Well, if you break their conditions of free distribution, then you shouldn't
>be surprised if they take away that free dist.

I quite agree. Its just that Atari have taken a very strange line on this.
If they don't want people to distribute home brewed versions of the MTOS
kernel then why don't they compile a definitive version and release it.
It seems unfair that among the legal owners of MTOS, only those with the
most experience and best equipment can have the latest versions.

Which programs (eg. word processors, converters, readers, etc) can read
Microsoft RTF files (Rich Text Format)?

Anyone else seen the Hugo & Nebula CD-ROM? Cool stuff. The Mac RTF reader
is disgustingly slow (it's written with Hypercard).

Another nice program is "UPoint" - you may get the "light"-version for
free. But look out for the latest version (29.Dec'93 or later).

Send a mail to brusch@eslapion.sh.sub.org (Stefan Brusch) to get more
information about it.

Message-ID: <1994Jan19.100341@zam067.zam.kfa-juelich.de>
Source record: 194654

Hello

I bought the modem for DATEX J from german TELECOMM for my ST.
Even if I want to use it mainly for DATEX J, I've tried to use the fax-option.

The modem accepts Haeyes and V.25bis (I actually don't have its name right here)

I've tried HACKFAX 1.1, but it only responded: "Modem problems?".
I know the modem is not a Zyxel. Maybe the problem is, that 19200 Baud are
not available (max. 14400)

COMA150 dialed and connected, but the modem hung up, when getting parameters.
The last command in the modem-log was : "AT+FET=2"

Another point on COMA is, that I actually don't know, if I'm really willing to
spend 100,-- DM for FAX.

Does anyone have a solution?

Regards

Helmut

|>

Well I bought one a while ago, and apart from the fact that it wont drive a UK television set so I need to buy a monitor and the Phillips CM8833 has just been discontinued I'm really happy with it. One thing to look for is if the floopy disk is HD or DD - mine is DD but I'll probably upgrade it soon - it's all a matter of preference.

|> More specifically, is there a space for a hard drive in the
|> Mega case, and is this supposed to be a SCSI drive. I already
|> have a home built drive, and most of the reason for wanting
|> the mega is to get it all in one box.
|>

Yes, you can add an internal hard drive - I did that just after I got mine. You need an Atari kit which includes a new right section of the case to mount the drive in and the internal SCSI adaptor. You also get the AHDI software but I would recomend using the ICD PRO package 'cos it's generally regarded as being much better.

Hope this helps,

Martin

Or look out for UPoint. It's a full GEM-based UUCP-Point. You can get it
on ftp.tu-clausthal.de

>and on the Falcon. No prices are advertised :-(

It works fine under MTOS, with color boards etc. and with Speedo. The price in Germany is around DM 300 - 350 so I would estimate a UK price of around
100 - 120. Cheap and powerful. The best GEM WP package I've seen. Does calculation too!

>>... a port to a database systeme (phoenix,adimens) ?

I think it also has an interface against DB's. Not sure of which, though.

Allthough it is technically piracy, i would like to make a comment: If
software isn't supported and supplied by the original company, then you
can't obtain it legally anymore.. right? so if you want it, I think you
are allowed to copy it, because the original creators don't give us -
the honest people - a way to get it legally.

Remember: This copying thing is just when the program isn't supported and
supplied anymore.

In the Uk at least, the law doesn't see it that way. Even if a
program/book/video/whatever isn't available for purchase new, it doesn't give
anyone the right to copy it. It is still copywright and enjoys all the rights it
had when commercially available.

I want to know about the timings of POV with a 68882.
I heard that i will take less than 2 minutes to raytrace a 160x100
tgaoutput file. I didn't believe that, because this info was supplied
by a 68882 seller, and I have pov 68030.ttp which does an extreme simple
picture: three balls no textures (like stformat example) and needed 8
minutes.

Please contact me as soon as possible - because i must decide to buy one
68882 before the weekend. (special computer fair in the weekend).

Please ... Help.

Apple (computer) were authorised by Apple (beatles) to use the name & logo as long as they didn't go near any music related lines of business. If Apple(computer) start selling music boards/MIDI cards or somesuch, they might well run into trouble if Apple (beatles) notice.

>screen using the above methods, and then overscan it to something
>silly like 1280 by 960? Sounds kind of fun (if a little difficult
>to read) to me... is there any reason it couldn't be done? TIA...

It's NOT a bad, idea, BUT:
If you double the information quantity (640->1280) on a single line:
- either displaying this single line will take twice the time
- either the frequency of the signal will be doubled
- either a combination of both.
The second solution is difficult to implement: you wont persuade your ST
to display more bits (i.e read twice more bytes in memory) in the same
amount of time (for this, use a VGA graphics card!) !!!

The second one is not feasible neither: the monitor won't synchronize with
such a long (in time) line, and even it it did, this would make a 1/35 (and
NOT 1/70) frame rate (if you don't increase the number of lines in the
image, worse if you do it)...

As you can see, there is no other solution than a separate graphics card with
it's own video memory (with faster access, i.e more pixels in the same 1/70s
frame) like a SVGA card AND a better screen that can deal with:
- higher line frequency : more lines per frame
- higher pixel frequency : more pixels per second.
(you get it: a SVGA screen or alike !).

Conclusion:

It is physically impossible with the rebgular ST hardware.
You can still get some extra pixels that are normally in the border, but
simply not displayed, and that's what Overscan cards for STFs do.

I'm as sorry as you are :-)

Don't take this in the wrong way, but who's to decide whether copying
is allowed or not? It was the company's (or author's) decision
to spend time and money to create the software (and possibly
distribute it). The company/author created it, and owns *all*
rights (know what a *copy*right is?) to treat it how *they*
feel it should be treated...

Now, obviously if a company has discontinued an item, there's less
of a likelihood that they will try and prosecute you - but that
doesn't mean they said "go ahead and take our copyright away."
It's your conscience and sense of ethics that will decide this...

Rob

Possible solution to the Powergraph-Problem in 'Civilization':

if you run a machine with more than 1 mb then use a prog to simulate
a 1-mb machine.
i am now able to retire on my own or quit the game via spaceflight
and enter the hall of fame without problems.
only ending the game via planet-conquering still gives me four bombs - i
think i am missing a few files - anyone out there who could mail
a complete list?

so long,

Sounds overly pessimistic to me... The figures quoted elsewhere varies between
50,000 to 75,000 Falcon's sold worldwide. At least 1,000 of these in Sweden
alone. And yet I think this is a low estimate.

BTW, that should be low price and high power! :-)
(8,000 SEK incl tax = $800 USD excl tax for a F030/4/0, not that bad!)

Could you please run tests in 640x400x2 instead since this will
normally give you 100% on all tests, thus making it easier to compare with the
new results.

Anyway, I'm surprised by the low speed impact of this upgrade. FastRAM is
obviously needed to make the Falcon fly...

That's right. Co-operative mt is based on the co-operation (what else :)
of the programs competing for resources. When an apllication is granted
CPU control it can keep running as long as it wants to.

Pre-emptive mt means that an application may be suspended at any time, the
operating system decides when switching between tasks occurs.

Note that MTOS will not pre-empt a task while it is running in supervisor
mode. Applications should never use that 'feature' ;-) to prevent
taskswitching.

1262. Stylus 800 printer driver

Date: 1994-01-19 14:43:25 UTC
From: mcssesw@dct.ac.uk
Message-ID: <1994Jan19.144325.10402@dct.ac.uk>
Source record: 194672

Does anyone know where I can find a suitable printer driver for Firstword Plus to power an Epson Stylus 800 inkjet printer. I phoned both GST and Epson. GST says that it is Epson's responsibility to produce suitable drivers for its printers. Epson says that its GST's responsibility. Why does it not surprise me? Is anyone using Firstword Plus with the Stylus? Is an actual Stylus 800 driver required, or will any LQ-xxx driver do instead?

I thought that the combination of FOLDRxxx and POOLFIX was supposed to address
this problem. Am I wrong? Are there still limitations?

Steve

1264. Re: Problem with AES

Newsgroup: comp.sys.atari.st
Date: 1994-01-19 15:30:14 UTC
From: marcel@eba.eb.ele.tue.nl
Message-ID: <2hjjm6$rdc@tuegate.tue.nl>
Source record: 194681

This discussion is getting out of hand. I started this thread to get some answers on a problem with AES (as the subject still says) and now it's "Who's sueing who, why, how and what for?". Maybe it's time to start a new thread? (try comp.sys.atary.advocacy or something). No offence intended, of course, but every time I see 'Problem with AES' coming up again I do hope to get some relevant information concerning the AES.
^^^^^^^^^^^^^^^^^^

So again: anybody who know of a way to write a patch or an application which watches the AES buffer and issues some warning when it's getting stuffed up?

Eager to hear from you,

--- Marcel

I don't believe this. It has something to do with the new registers
in the video chip, and programs which write data into those registers
which is normally ignored. I know, because I have been writing software
that makes use of the registers (have a look at stretch.prg, and notice
that it scrolls two pixels at once---I would get the shift problem when
I scrolled by 1 pixel).

Sorry for the bandwidth, but I'm terribly stuck in Dungeon Master (v 1.2). I could probably figure it out on my own if my wife didn't constantly get on my case for 'always playing that damned computer game!' It's kind of difficult to keep track of which buttons I've pushed with her whining all the time ;)

Anyway... I've got the maps from the umich archives, but am still having trouble. I can't seem to find the ways to open the secret doors on the 'Arena' level (the level after the Firestaff Tomb.) Since I need to get to the lower levels to get enough Ra keys, I'm screwed. I've gotten down to the 'Rat' level (where you have to walk through the 'not a rock' wall), but that's as far as I've gotten. Well, there and the one room I can get to below the chest with the green gem.

All I want to know is how to open a secret door (or three :) so I can continue my quest. Any and all help appreciated. E-mail instead of posting would be fine, not to mention a save in bandwidth.

Thanks in advance!

>

It's the old extension for GnuZip by the sound of it. The default
extension has now been changed to .gz as the distinction between UNIX
.Z and Gnu .z was easily confused.

Try gunzip or gzip -d if you're on a Unix system, otherwise Atari and
MS DOS versions are ftpable from src.doc....

Sam

P.S. Somebody recently asked if .tgz was tar+Gnu Zip, it is, and Gzip
will recogize this and untar it automatically.

>>disk, from where they would be read. Is this true, as I don't think this is the
>>case. Anyone?
>
> I'm not a hardware expert, but that sounds like an awfully ridiculous
>way for something to be done

Obviously, the contents of a CD-ROM are NOT copied to a hard drive, mainly
because that can be over 500 megs of data, which wouldn't fit on most
peoples' drives. However, one thing that IS becoming popular on Mac software
drivers for CD-ROMs is copying the directory structure (not the files)
onto your hard disk for cacheing purposes. This is a great idea since
it is MUCH faster to find a file on the CD. CD drives are very slow.
However even this scheme can take up a few meg on your hard disk.

Message-ID: <1994Jan19.181858.29154@nessie.mcc.ac.uk>
Source record: 194689

Hi,

Does anyone know of a public domain Ada compiler for the ST ???
Is there a GNU Ada compiler ??

I'm going to have lectures this term which include some Ada and it would
be nice if I could play around with a few programs - I don't want to do
anything serious.

If there's nothing for the ST what about for Sun's ???
Replies by e-mail would be greatly apprectiated.....

Thanks in advance,

Andrew.

But it sounds like the reason the program isn't supported anymore
is due to the rampant piracy of the ST version. The people who
are usually get hurt from piracy are the honest people.

Sounds a bit like an attempt to justify piracy to me...

Do remember that even if you do convince yourself that copying a program
that is no longer available is OK, the company concerned is still well
within its rights to "sue your ass off."

>Remember: This copying thing is just when the program isn't supported and

Actually, I heard some time ago that Apple (records) started an action
against Apple (computer) because they didn't like Apple selling CD-ROM
drives. They argued that it constituted "musical business" (because they
also shipped software to play music CDs in the CD-ROM).

Never heard anything more, though.

To shed some more light on this, PRL is the Prospero Resident Library - a
little program that had to be running in *older* versions of the Prospero
fortran environment. According to their documentation, this program
could be (in fact had to be) provided freely along with the compiled user
program. Newer versions of their compiler (starting about 3 years ago??)
don't use this any more.

Geeez, Ofir... do you own stock in NVDI or something??? I agree it's a nice utility but your constant remarks make one think that Warp 9 is junk and that absolutely is not the case. And like it or not, there are some distinct advantages to Americans buying American products (cost being just one of these).

Singing the praises of your favorite product is fine, but tempering that with a little logic goes a long way towards strengthening your argument.

Cheers,

2,5" IDE drives are way cheaper than their SCSI brothers, and that's what
you need _in_ Falcon030.

btw, in the meantime, the 3,5" externals are cheaper again. Since there's
almost no supply of 2,5" IDE drives, prices went back up.

That's a well-known problem. Reduce the amount of messages. Why not join
the WM_REDRAW messages into one _before_ sending them?

The TT outputs data too fast for your printer. In Calamus' "Print" dialog box, select "Other" instead of "Parallel". This will make Calamus use TOS calls for output instead of direct hardware access.

I still have the following ST software for sale. Most of the programs have original documentation and packaging. Many of these are excellent! I need to get rid of this stuff, because I am moving in a few months!

I lowered a few prices. I think the prices are fair, but if you think the prices are too high, make an offer. Buyer pays shipping (typically $3-$5).

If you are interested, email to 'totty@cs.uiuc.edu'.

In <2gtb0u$cnb@golem.wcc.govt.nz>, Steve Wells writes:

Hi,
and I thought I was the only owner of Elite II/ST...

>Do not use the identify objects item (F10 - Identification Text Icons),
>the text produced seems to really confuse the autopilot, as it appears
>to think it is an object, and usually crashes you into the port/planet.
Interesting theory, Steve. I'm using this feature quite often and never
had problem with the autopilot crashing me into dock while I was on
max. stardreamer...

But there are two faster ways to get to a station, one legal since
you're only using flight physics and one illegal using a bug.

legal way: set your target, switch on the autopilot and wait till it sets
your gunsight onto the target. Switch to Engines off, press down return
continously and select max. time acceleration.

If you're half way to your target, switch to normal time, release return,
turn you ship around (use rear view to center your ship), press return
down again and select max. time speedup. You'll end up really near your
target (0.1 AU after some practice).

HOW IT WORKS: The autopilot tries to make the trip convinient, no long
or extreme accelerations, saving fuel whereever possible. As you can see
on your external view, the thrusters are off most of the time.

This method uses your main thruster to accelerate half the way and to
deaccelerate the other half. It does consume MUCH MORE fuel that the
autopilot so I wouldn't advise you to use it always, but if you're in
a hurry...

illegal way: starts like the legal way but instead of turning your ship
after 50% of the way, keep on accelerating. Wait until you're 2 AU away
from your target, switch to normal time, switch on the autopilot and
select max. speedup. The autopilot will do an emergency deacceleration
and get you to your destination... Consumes even more fuel than the
legal way and should only be used in emergencies. Ah, and don't switch on
the autopilot too late, you'll end as far away from your target as you
started...

[starting strategy]
>at Sol. Before you sell Robots or Computers always check the bulletin
>board first, as there is almost always someone willing to pay twice the
>Normal price.
It pays off to check all three earth stations before selling, waiting till

midnight on each of them. At midnight, the bulletin board is rebuild giving you an extra chance of someone needing robots. And the bulletin boards of the three stations are not identical...

>your cash. Buy a larger ship ASAP capable of at least 6 light-years
Be careful when buying larger ships. Sell everything except the drive before selling your ship. If your new ships needs a larger crew than your current crew, consult the bulletin board first to see if you can get the men (and women) you need. Sitting on a base for a month paying fees and wages while waiting for the last crew member is frustrating.

Ah, don't be keen on money. Get your 3 million credits, sell your big trader and get a smaller ship. I recommend the ASP Explorer with a 4 MW beam laser, scanner, autopilot, radar mapper, laser cooler and a class 4 drive for most purposes (add hyperspace cloud analyser/athmospheric shielding when doing assassination missions). With this configuration you can do the sol->facere trip in two jumps(!). There is almost no other ship with this range (ok, a Cobra MKIII with a class 4 engine can do 50 light years on the paper, but did you try to do it? It lacks cargo space to carry the fuel, not to speak of weapons etc). Before going for kills, try to collect the three permits needed in the game (Ross 128 prison permit, guardians permit (van Maanen's star) and commune visitor's permit (YZ canis minoris). Just for the case your assassination target flies to one of these systems.

If you think you should go on one of those "I want kills" campaigns in the outer rim, you should trade the class 4 drive for a class 3 drive, 5 shields and an energy booster unit AFTER ARRIVING OUT THERE. I advise to go to the disputed system of ZEAEX at [3,-2] and clear the area (there are about ten anarchy systems aroud ZEAEX, keep choosing different systems in order to get new enemies) :-> Use your system card (F2/F2) to find and your autopilot to get to the other ships. Happy hunting :-)
Save after each kill just in case you meet someone with an energy bomb (grr, 50% hull damage by that device in one secound, I do HATE it, they always cost me 5000cr of my assassination contract payoff).

>have to be launched when the enemy is within about 3Km of your ship. He
>will then run away, you can lock your autopilot onto him, and when he
>eventually returns and gets within 5Km, hold down fire and as long as
>they haven't got tougher shielding and lasers than you, they will
>almost certainly blow up!
Hmm, I don't use missiles (I don't have the space nor the pylons for them), but there is another trick. If your enemy is near, tell him to "Surender or Die". He'll answer "Ha Ha" and retreat to about 12 km. Switch on the autopilot and wait till he comes back. Good bye :-)

If you're using a ship with more than 3 shields, you can fool the small ships. As soon as they attack, target on them, switch on the autopilot and wait. They'll crash into your shield and die. Don't do this with less than 3 shields or you'll suffer hull damage.

Bugs in the ST version:
- Bulletin Board doesn't scroll. Fix: Wait till midnight
- Frontier always wants to load the commander file from drive a: after start and will bomb out if there is no disk. Fix: obvious
- Hyperspace could analyser bombs out if you analyse your own cloud.
Fix: Be careful what you check and complain to gametek/konami

Ok, that's it for now. See you out there in the rim.
/s/Udo, ASP explorer NE-035, currently clearing the ZEAEX region
PS: If someone needs more infos (how do I do assassinate missions etc) feel free to mail or post

] Also STFormat (at least in this article) don't seem to have heard of
] pre-emptive multitasking, which if I'm not much mistaken is what MTOS uses.

ST-Format, despite claiming information links with Atari, rarely seem
to have much idea of what they are talking about! They can review
software, but not give much info' on the background of the things!

Quite often even their 'special features' contain a lot of in-correct
information which could cause problems if people tried to use it
as they suggest...

ST-Review usually gives pretty good info', but it's quite rare!

* * * * IN SEARCH OF "ROLLING RONNY" !!! * * * *

A little less than a year ago, I purchased an Atari 1040 ST computer which also came with game software. Recently, I and my godchildren have been playing the demo version of the game "Rolling Ronny" and we have really enjoyed it. The demo version was part of a "Cover Disk" which accompanied a 1991 issue of the ATARI ST magazine (???).

I am interested in knowing 1) whether or not the full running version of this game was ever manufactured and, if so, 2) where I can legally purchase/ obtain a copy of this game.

If you have any information on "Rolling Ronny", please feel free to contact me via my e-mail address

etcoles@mwvm.mitre.org

Thank you very much in advance and have a nice day.

Yes, and Yes. You may use MAC style 8-chip, DOS style 9-chip or the new 3 chip SIMMS , and there may be a two chip SIMM (not sure about 2, but 8,9, and 3 will all work). Just make sure its either 256K or 1MB SIMM of between 80 and 120ns. I think I have either 100 or 80ns SIMMS. Speed doesn't matter since the MMU always uses a 120ns access (SLOW!).

I would suggest 9 pin SIMMS since they are usually cheaper and have a better resale value (since DOS users can use them). Don't EVER buy 256K SIMMS since you can't get rid of them. The 4 8-chip 256K SIMMS that came in my STE are worthless (I changed them all with 9-chip 1MB SIMMS). There is just no demand for 8-chip, MAC-style, 256K SIMMs (slow ones too).

Hello, there:
I posted a question about modems/software for Atari 520ST. A few kind people helped me a lot. Thank you guys for your help.
I have got the anonymous ftp site for Uniterm. But I can't download it without a telecommunication software at hand. I guess I can't use a pc to down the program to a disk and then use it on my Atari 520ST.
Is there a way to get arround it?
Or if someone lives Gainesville Florida with Uniterm, I may copy it from him/her. If you do live in Gainesville, Florida, and want to help me out, would you please let me know? Thanks a lot.

Sincerely,

Min

I just put a TEAC in my STe. Its real easy. Just unplug the old drive
and plug in the new one in its place. Be careful, the power supply plug
has a little locking tab on it - don't break it. The TEAC required
that I turn the cable upside down (data, not power) to make it work.
Drive Select MUST be 0 for any ST drive, NEVER 1 or the system will not
see it. Also, I had to make a very minor case modification so the new
drives eject button would fit through the hole. I basically broke the
peice of plastic between the eject button and the disk slot itself.
So now there is only 1 opening in the case - the eject button hole is
part of the entire cut-out. The nwe drive is much nicer than an Epson
(what ATARI uses). Oh I dressed up the break in th plastic with a soldering
iron and hobby knife so it looks like it was manufactured that way (it
should have been IMHO).

I'm still waiting for TEAC tech support to call me - I need to find out
how to get this drive to output density select so I can run it in 1.44MB
mode (my 1040STE has an AJAX in it, so I just gotta add some switching
circuits based on the density output pin).

Its just plug and play for 720K or for using a 1.44MB as a 720K.

(to cspas050@sus.edu.eur.nl (M.A. Onstwedder)
MO> [...]
MO> Allthough it is technically piracy, i would like to make a comment:
MO> If software isn't supported and supplied by the original company, then
MO> you can't obtain it legally anymore.. right?

Wrong. You could conceivably get it second hand. People have been executed for "technicalities", don't underestimate the potential literal bloody-mindedness of a legal dispute.

MO> so if you want it, I think you are allowed to copy it,

Wrong again. The product would have to explicitly say you could, or alternatively have been released publically, say by way of cover disk, as freeware or shareware. This last _does_ happen quite often though.

MO> because the original creators don't give us - the honest people - a way
MO> to get it legally.

If the product is dead, it's dead. Don't flog it, copy it, or upload it.

MO> Remember: This copying thing is just when the program isn't supported
MO> and supplied anymore.

Copyright allows nothing of the sort, and although general practice is to extend copyright into software, most companies do not even rely on this, but stipulate even stricter requirements by trying to bind the buyer to a "licensing agreement" as of the act of breaking the seal/wrapper on the package. I will admit there is an ongoing discussion in various places about the legitimacy of all this, and historically there is a distinct split in the software area between the advocats of total freeware vs. the normal businesses who wish to sell propriotary products. So far the reality of the situation is that software is viewed as a legitimate commodity to buy and sell and is legally protected from unauthorized copying. The reality is also that there is a lot of unauthorized copying of various copyrighted and licensed material being done -- music, books, software -- seemingly with impunity, but those who do so are open to prosecution and would likely lose with expensive results if this happened.

I> they might well run into trouble if Apple (beatles) notice.

This was the threat used a while back when Apple (computer) was starting to make too big a fuss world-wide with all its look&feel lawsuits. Apple (beatles) brought up this contract, signed by Steve Jobs, and waved it under the Apple (computer) board's noses citing just MIDI etc as a breach of contract. The board apparently had no idea (Jobs wasn't around anymore), but backed off some. More backing off ensued when Xerox pointed out that _they_ actually had originated WIMP "look&feel", and although Xerox had released the concepts into the public domain, they just might sue Apple if this fuss continued. The final backing occured in the courts, where the judge in disgust told the Apple lawyers, that most of the case was being thrown out of court and if Apple didn't get less touchy about look&feel, the judge was personally going to have certain Apple patents thrown out too. Things have been much quieter since then...

Anyway, Apple has a lot to think about lately concerning market shares and a general lack of inovative new designs. Newton hasn't exactly made a big splash...

True, but the AES and the desktop are in a seperate file from the MTOS
kernel. All the MTOS kernel is, is a MiNT kernel which loads the MTOS AES
instead of jumping into the ROM.

Dare I say, an Atari SC1435?

Very similar to a CM8833 Mk2, but no composite video or SCART socket.
Cheaper too, by about 20ukp.

Roland.

SCSI 2 is downwards compatible with SCSI 1. I have a Seagate ST1280
connected to my AdSCSI+, no problems.

Its just that you don't get all the benefits of a SCSI 2 drive with a SCSI
1 controller, so you are paying for features you don't get to use :-|

:-)

Sorry, I don't follow you there? Anything that relies on large numbers of
ROM replacements is impractical. ANything that relies on any particular
version of the ROM is unfair ;-)

I suppose Atari could distribute stuff as a self extracting archive, that
extracts itself everytime it runs (like DCSStuffer). That way, if they
encripted it as well it would be almost impossible to patch the binary.

Is there any software out there to drive a floppy tape from the external floppy drive port on the ST(e)?

I have an old cypher 525 tape drive which can run from an IBM (swearing again) XT floppy controller.

If that is an impossible dream, does anybody know of software to network PC and ST(e) so that they can see each others drives as if they were local?

If it hasn't been done I will pobably write something but it will be a long time coming.

1313. REPOST: Mega ST for Sale w/ Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1994-01-20 01:17:33 UTC
From: barber@sugar.neosoft.com
Message-ID: <barber-020104190326@pvillage.neosoft.com>
Source record: 194762

I'm looking to sell this system so I'm postin' again:

Mega ST2 upgraded to 4 megs, 40 meg internal Supra drive
Spectre GCR
Color Monitor
Monochrome Monitor
1200 baud modem suitable for use as a doorstop

software:
Word Perfect
Word Writer
Pagestream
Cad 3D
a hundred or so disks of PD software from Current Notes (DC area user group mag)
several years worth of disks/magazines from Start, ST Express, ST Info...

includes PD disks for Spectre
the Mac partition of the internal hard drive has System 6 installed along with
Microsoft Word, Illustrator, Freehand, ReadySetGo, PageMaker.

I've revised the price since last time:

$500 or best offer

The ST, the monitors, the disks, the software, the magazines - please make it
all go away. I enjoyed using this system, but now I've moved on to other things
and it's just taking up shelf space. I can't justify spending more money on it
to upgrade it.

I am a 'pro' musician. I am now in a 24 track digital recoirding studio
mixing a new album for Sony Records. Cubase Audio is of no interest to the
majority of ST Review readers (going y readers' surveys, etc.). It was
about 2000 words. A mag like SOS will probably dedicate 4000 to CA.

Sync between audio and MIDI is perfect to my ears. RAM sampling is only
possible with 16MB and is very simple as it stands.

The sample quality is not a feature of Cubase, but of the Falcon. I have
covered the sample quality of the Falcon in at least three other articles
(Musicom, Digitape, Musicom 2 preview). I felt it would be boring to
repeat myself.

Vic Lennard (the editor) hardly ever touches my articles except for
sorrting out grammatical errors and the likes.

I don't have the time to write a mini-review. Papyrus supprts RTF, runs on
any TOS machine, is res-independant and MTOS compatible. It is capable of
background printing, supports Speedo and Signum fonts and looks very good.
It uses a non-modal interface.

Well first of all you need to learn how to press RETURN after you've
typed in each line of your message!!!

either Uniterm (which isn't very user friendly, but is very powerful & free),
or CoNNect (which is more friendly, also powerful, & costs)

Both are available via FTP.

I don't think much of the Commercial software for the ST in comparison
to the Shareware/PD avilable.

The Mac one is the right one (8 pin), but I think the DOS machines one
will also work. You'd better check with someone that knows on that
last bit though.

>that, if I set the RS-port to eg. 2400 bps, it will never connect at
>anything higher than that, whatever the other settings might be.

Switching a SupraModem 2400 Plus between two systems has run me into this before. My copy of Flash here at school is set up at 9600 upon loading. That is what speed the Plus wants to talk to the computer at for optimal data transfer.

My computer at home defaults to 2400 (since it only has a 2400 modem on it right now). I have occasionally booted up the computer at home, loaded Flash and connected forgetting to set the baud rate to 9600 manually. In each case, the modem has connected at 2400/REL-LAPM-COMP (v.42bis). This means that the modems are capable of high speed communication with each other, but the computer and modem aren't capable. I can usually drop back to the modem's OK prompt, reset the baud rate, and ATO to get everything going once again.

>Even if it would work, it would be a waste to get a modem that is faster than
>the computers serial port.

Well, according to the docs for HSMODEM1 and HSMODA02 (with the MFP driver), a stock ST is capable of 57600 with these drivers and a term program that supports them (Connect, Rufus, and GEMSZRZ are purported to). A 14.4k modem with v.42bis is only capable of 57600 at best, so the ST shoulld be able to handle it thus making no modem a waste.

Can you explain this hardware mod? I saw this part, but as one person has
already mentioned, the docs go on to say that an 8MHz stock ST can make 57600
with FASTINT set, and with the RSVE or RS-Speed mods 115200 is possible.

>been installed in my auto folder ever since !!

Hmm. This makes me wonder ...

I did the compile on a TT030 with MTOS, and since I had memory to
spare, I made extensive use of the ramfs.xfs by loading all of the executables
and libraries (basically everything in my /bin and /usr directories) into the
the ram disk. Since the TT is roughly 4 times faster than the STE, and since
everything except the source code was in the RAM disk, I would expect at least
another 2x performance, or 8x faster in all. My compile time was 25-30
minutes. Am I missing a trick here for improving my compile throughput? All
of my binaries were downloaded from A.A. and all of it recent stuff -
GCC2.5.6, make 3.36, bgas (3.9? whatever the newest was...), the newest MINT
libs (and tos libs, but I used the -mint), and the bison 1.9. (BTW, all of
these numbers maybe off since I have already deleted the archives a couple
weeks ago...). Maybe someone has done a 030 compile of 2.5.7? The gas?

: Why not run MiNT? You can run your Unix stuff, your TOS stuff, and still have
: GEM! Need memory protection? MiNT has it. If you want VM then you can buy
: the driver. MiNT is much further along than 68K Linux and Linux is so DOS
: oriented they will never get the 68K version as efficient as the DOS version
: without a total rewrite.

I believe that you wanted to say 'Linux is 386 oriented', coz it
has not much to do with DOS except that it can read DOS partitions.
Now let me tell you why I'd like to hace Linux on my TT too...

-It has X-Windows.
-It has lots of good PD programs
-MiNT never ran well on my TT: only few of my programs still
run, and I don't want to buy brand new ones, so I keep my tos 3.06
without MiNT.
-It is STABLE
-It comes with a huge heap of utilities as standard
-It's FREE and often actualized.

That sounds about like my experience! Mine wasn't quite so drastic. I have had SPICEST choke on some of the PSPICE files shown in my Circuits book.

Have you seen a PROBE-like interface for the ST? PROBE on our VAX has a faultly TEK4014 emulator. I tried it with Connect and with the Graphon terminals in the lab, and it gave the same screwed up display. Right now I'm just using text display and sending the hard copy to a file for my Panasonic printer. It works ok, but I'd like to have graphics output on the VAX. ST versions of the PSPICE package would be nice too! <g>

Robert A. Bruce,

Thanks for posting the information on the GEMINI CD-ROM that's available
for the Atari family of computers. I'm interested in it although I don't
have a CD-ROM player as yet. A friend of mine does (on a clone) so even
if I forgo getting one for my Atari for a while, I can still use the CD-ROM.

Thanks again and TYL, Scott Dowdle

Source record: 194795

Hi Atarinetters,

I'm using Faxstf for the Mac on the spectre. Receiving is no problem, but sending gives me an error every time I try: ERROR -7050: Modem underflow: close applications or too slow processor.

This error persists on all speeds (14400 - 2400).

Does anyone have an idea about this or knows about working Fax software (on the spectre)

using a USRobotics Sportster 14400 Fax on a mega ST2 with spectre GCR and system 6.0.5

thanks, Edward

Hi,
Just had a major crash down on my hard disc and one of the
very valuable items I lost was a .hex driver for my laser
(HP-laserjet II) ie. the one that's used with 1STWORD etc.

Could someone mail me one (uude or ?)

or give a pointer where from I could get one ?

It would be nice IF the 8bit characters were defined
ie. German,Swedish and Finnish would get printed right..

Thanks !

1343. Conner Drives + Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-01-20 11:13:12 UTC
From: xa383@city.ac.uk
Message-ID: <xa383.759064392@Euston>
Source record: 194703

I have been tryting to get a conner CFA 340S hard drive to work with
a Falcon that has no internal IDE drive. Sometimes the drive works ok
but 90% of the time, the falcon sends a message to the drive, the drive
locks up and doesnt start working again until I reset the computer.
The drive locks up after the second disk drive access after the fuji
symbol appears.

Has anyone goty any idea what could be goung wrong.

The falcon tos is 4.01.

Yours

Graeme Mathieson.

: : : to have a real Unix in your Falcon?

--
We have been using Linux for more than one year now (since 0.97 is out),
and I personnaly asked from time to time if someone was working on an Atari
version, but I nerver got any answer :-(
So I'm ready to help and participate for such a development. I think it
would be great for Atari if Linux was on their machines. I want to use Linux
on Atari just the way I use it on our PC. I'm currently working (when I get
enough time) on a complete GNU package for Atari under TOS, cross-compiling
on my Linux-box all the Gnu packages, I modified the Bash port from Scott
Kolodzieski to get it working on all our Atari computers the way I wanted
(that is, just like my Linux bash). It's not Linux, but it begins to looks
like...
For those who dont know us (Brainstorm): we work on Atari computers since
around 8 years. We made the Atari Jpeg decoder and the Atari DSP debugger
for the Falcon. We made a complete assembly package for the Atari (Assemble
& Adebug), and we just put on ftp.uni-kl.de our last FLI/FLC viewer (called
movie100.zip). We are in charge of the French developpers support for Atari.
This was examples of our work on, and for, Atari. I personnaly now use my
Linux box for all my Atari development, because I just love it. It would
really be great if it was ported on Atari, and i'd like to help, but
infortunately I hav'nt enough time to coordinate such a thing. Any
volunteer around?
Please forgive my bad english, btw.

|> To Steven: send me email, and I'll be able to send you a working archive. Note
|> however that m1_banks runs only in ST high-rez (the acc runs in both high and
|> med rez, if all's well).

It's okay, I've managed to unpack it using arc 6.02. I suspect one of the earlier archivers I tried messed my HD partition because arc 6.02 wouldn't recognise m1_banks.arc as arc file until I'd replaced the partition from backup.

The only problem now it that when I run m1_banks.prg in ST hires compatibility mode on my Falcon the screen goes blank & nothing happens. The documentation programs run fine though. Several people emailed me to say m1_banks works well for them so maybe I should get my ST & mono monitor out of the attic.

You were either talking to an idiot or an MS-DOS user who is an idiot.
A CD-ROM is a bit like a _HUGE_ floppy disk with the write-protect on;
you don't need to copy things from the floppy to your hard disk before
you use it, do you?

Please read my posting more carefully next time. I clearly said
'MultiTOS kernel'. If I remember correctly, the question to which I
was replying was about building an up-to-date kernel to use with his/her
MultiTOS. That is exactly what I started doing last night; building
a MiNT 1.09 version to replace the 1.04 kernel that came with my
MultiTOS.

>ported to the ST.

No, GNAT goes *not* translate Ada to C. GNAT is the GNu Ada Translator --
it's an Ada9X parser and semantic analyser ("front end") which calls the GCC
code generator ("back end"). There's no intermediate conversion to C -- the
front end (written in Ada, incidentally) drives the code generator directly.

I haven't heard of an ST version. I'd do it, but my 1040STFM only has 2MB of
memory (and cannot be upgraded to take any more -- thanks Atari), and 4MB is
the minimum for gcc/GNAT (GNAT is really a version of gcc that understands
both C and Ada programs -- two front ends, one code generator).

You can get the full sources for GNAT from ftp.nyu.edu, and binaries for Sun
SPARC and OS/2. There are ports on other sites for just about every other
platform... perhaps the ST GNU porting people can have a go?

Note that there hasn't been a full release of GNAT yet -- just "snapshots"
of the development. There's still some way to go before it's a full Ada9X
release, but a lot has been implemented already (most of the OO stuff, for
example)

> AdaEd is an ada semi-interpretor, exists for Unix, MSDOS and Mac.
>Don't know for ST but perhaps...

AdaEd is just a plain Ada83 interpreter. There is rumoured to be an ST
version, but I haven't been able to find it.

Mat

BTW: ADA is the American Dental Association. Ada is the language named after
Byron's daughter, Countess Augusta Ada Lovelace, patron of Charles Babbage.

There is one on atari.archive.umich.edu for the ST. It is pretty good and
does use the mouse. I don't know about the STE support. I think it was
just called Centiped.lzh or something.

When you open the harddisk cover (with the big screw under the housing)
you'll find the SIMM sockets immediately (can't miss it) just in front of
you.
There are 4 slots, two of them are used. Just put the new ones in the
remaining slots. Close the box. Enjoy.
Remember: the two SIMMs you add MUST be the same type (size). You don't
have to touch the existing SIMMS, or anything...

GV>That means dealing with german operating system in the rest of my life ..

I have my PAK3 running in a 1040ST since some weeks - it's great!

TOS 2.06 does not work very well with the PAK, since the PMMU is not
initalized properly. If you do that by using an auto program, the computer
will hang on the next cold boot, since the PMMU tables are overwritten.

The best solution is to get the patches for a TOS 3.06 - the patch file is
available for free, but it is not allowed to upload it to any server other
than the german 'Maus PE' BBS. If you are interested, send me a mail, I will
then send you a copy via mail (I think that's allowed). The patch is for a
germa TOS 3.06, but it should be possible to change it for a different
language TOS - it would require some assembly knowledge.

If there is interest, I can also put the Jedec files for the GALs on our FTP-
server.

>
>I actually hate Current Notes. ...

< Ed's long diatribe against CN consciously deleted >

Ed, from your post it sounds to me like there is more at work here than just your disdain for "sloppy editing" and "wrong information." Did Joe Waters kick your dog or something? :)

But let's be realistic here... First of all, CN started life as a user group newsletter or more correctly, a newsletter for a consortium of Washington D.C. area Atari user groups. In the many years it has been around, CN has grown to become a separate, commercial enterprise yet it still retains much of it's user group heritage (good and bad).

Most of the articles in CN are written by users. If they don't like a piece of hardware or software, they make it very clear and, in my experience, very little editorial excising is used. They don't sway to their advertisers.

Unlike other magazines, CN lives up to the 'Current' aspect of its name. They do not suffer with long lead times as other Atari magazines have and still do.

CN is most certainly NOT an Atari 'mouthpiece.' Columnists ranging from Joe Waters, Dave Troy, Dave Small, and particularly, the late Frank Sommers have frequently upset the powers-at-be in Atari by being just a little too truthful, perhaps. But all this was done based on facts, not lies and innuendo as a certain not-to-be-named electronic newsletter became famous for.

As for poor editing, I guess I'm a bit more tolerant (though not usually) as I just don't recall any horrid examples in recent history. Hey, if you recall that older Atari magazine 'ST World' (not the UK version), they you will KNOW what truly awful editing is. It was almost unreadable!

But I digress. Bottom line is that each has to pick their own favorites. Over the years (10 at last count) I've come to rely on CN for a current look at this industry from the user's perspective. It's not perfect by a long shot, but it's well worth the subscription price, IMHO.

Each to their own, Ed. :)

You've hit one of the bugs which is in all versions. Once you've got your
military drive go into repairs and make sure you don't need to repair
anything, then make sure you hit the refuel button, even if you've got an
auto-refueller fitted.

>timer locks at normal speed (regardless of icon position). Sorry to moan but
>I've got a Panther with 2 million credits+ and I want to start FIGHTING rather

I've not had that problem, other than when a nasty pirate is hanging just
out of range.

1372. Bug in Lattice C 5.60 controlling program?

Newsgroup: comp.sys.atari.st
Date: 1994-01-20 17:41:01 UTC
From: hrs@aber.ac.uk
Message-ID: <1994Jan20.174101.601@aber.ac.uk>
Source record: 194730

Just received my update copy of Lattice C 5.60. Within 5 seconds of starting up the GEM controlling shell (LC5.PRG) I crashed the computer, 2 bombs followed by 10 (?) and then lockout. The bug is brought into action as follows. Go to the menu which allows one to change the compiler options and start the submenu. For some reason, the submenu appears on the left of the main menu (unlike my previous version) - no problem so far. However, pull the mouse to the right away from the submenu and click - bang! The bug is easily avoided by moving the mouse to the left instead (which is where the submenu is anyway).

One of the main reasons why I upgraded was to get the new Speedo bindings (plus manual information) and to use the profiler. Unfortunately only two pages are devoted to the profiler with no information indicating what the output entries means - I guess it's not too difficult to work out but it ought to be in the manual I think. I think the new reference manuals are more difficult to use compared to my original ones because the entry names for each function are typed in a small font which is difficult to identify when flicking through the pages. I can see however, that they've put in a lot of work and the upgrade was worth it.

This article is by Dave Haider NOT Paul Booth.

To all Falcon owners with Modems.
You may not be aware that there is a Falcon Dedicatede section in the HOLODECK and CHAMELEON BBS's. They have been organised by the Falcon Owners Group and include an active mail system and all the files in the FOG pd library which are available to anyone, you don't even have to be a member of FOG.

Please help support the BBS's, they are short on Falcon users.

The numbers are:

Holodeck - 0454 317047
Chameleon - 0454 881095

The BBS's are based in Bristol in ENGLAND.
Thanks for you time,
Dave

1374. Falcon Adaptor

Newsgroup: comp.sys.atari.st
Date: 1994-01-20 18:26:36 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <1994Jan20.182636.2236@bradford.ac.uk>
Source record: 194736

Note: This article is by Dave Haider not Paul Booth.
Any E-mail for me (Dave) should be headed "To Dave"

This may be of interest to anyone with a Falcon AND a low range Multisync monitor. By low range I mean one which has a horizontal frequency of between 16KHz and approximately 40KHz. See my previous letter on Comp.sys.atari for more details. I am offering a service of modifying a standard VGA adaptor for the Falcon. The modification involves adding a switch to the VGA adaptor which will allow the user to change between VGA and RGB modes without the need to remove the one adaptor and replace another of the other type (VGA or RGB). The modification if very simple and can be done by anyone who is capable of a small amount of soldering. If you want to modify your adaptor yourself I have seen an instruction file on some FTP sites called FALCADAP. This provides the necessary details. I must stress I am not the author that piece of infomation, I am just offering to modify the adaptor for people who do not wish to make the modification themselves.
The service will work as follows: You will post me your VGA monitor adaptor with five pounds sterling (6 pounds outside UK) and I will make the modification, pay for the components and pay return postage out of the money. Within 1 week at the latest (depending on how many people want the modification) will post the modified adaptor back to you. It will now incorporate a switch on the top which, when switched, will change the type of monitor connected. So if you then change resolution or re-boot you computer will be in VGA mode if it was in RGB mode previously or vica versa.

|> adversely, and they have no fix extant. Can anybody confirm/deny this?

I haven't notices any problems. On the ST the MIDI port is handled by the
MFP chip which has its own xtal. AFAIK the Falcon has the same arrangement
(though the RS232 has move from MFP to SCC) so I don't see why it should
be affected by the CPU timing (unless the whole MFP chip was).

The problem may be that most PRO MIDI companies do lots of TOS vector hacking
(see the current discussion in c.s.a.s.tech) which could well break on the
new processor/TOS version. One particularly common trick (to gain control of the
CPU *after* an interrupt) is make a fake interrupt frame on the system
stack whose return address points to your code and jump into a TOS interrupt
handler. This breaks because the 680[1234]0 have a different interrupt frame
format to the 68000.

Subject: PSpice for the ST.

I have heard recently in this group about PSpice for the ST,
and wondered if anyone knows where it is available. I use it on PC's
at University, and it would be nice to be able to use it on my own ST.

It is PD on the PC, so I therefore think I am not suggesting piracy with
this news article.

Could anyone with any info either email me, or post the group.

I do have to say that the effort to port Linux to the Atari platform is possibly the most important move afoot for the power users out there (TT/Falcon/et al).

As Atari continues to abbandon the upper end of the market we will need the assurance of having an OS which is actually still being actively developed for.

The PC linux scene is buzzing. There are loads of Apps being developed. Serious stuff.

The Alliance electronic CAD system would make me give up developing CLA altogether and join their development team if it ran on the atari (it runs on Linux and is PD).

X windows ? It's free. 3d look window managers ? Take your pick. Networking ? It's there - there are Linux boxes on the internet already.

I'm not saying that MiNT couldn't be made into a match for Linux - linux began as one man's dream (Linus Torvalds) as well. BUT - in my view, it's use as the MultiTOS kernal has effectively frozen that avenue. Unix compatibility is no longer a major target, and the cozy developer fraternity from a year or two ago has gone. Where is Eric now ? At atari - and effectively gone from the internet.

Of course, now that we have sockets, a port of X-Windows to the Atari on top of Mint may be a little easier. But not riding on top of MultiTOS - MultiTOS is a dog - to slow, to memory hungry, no Virtual memory (don't say go buy the driver - it should be THERE, even MS-WINDOWS has VM, and MS-WINDOWS costs less than the asking price of a seperate VM driver to work with multiTOS). Using X on a Sun 386i (a VERY old machine, before Sun

stop using Intel chips & started using Motorola ones) is faster than using MultiTOS on my falcon.

Summary
=======

MiNT needs non-blocking (interupt driven) disc access & virtual memory before it can even be considered for an X port, and without the X port, our machines will be junk in a short space of time.

So we need the Linux port to succeed.

I speak my mind.......no flames, no sticking up for MultiTOS, but informed comment appreciated.

I was in a music shop today and they informed me that the early Falcons had bits running at the wrong speeds which is partly why Cubase Audio crashes too often. Something about should be 16 and works at 15.997? Does this sound right?

Cubase Audio crashes far too often and I'd not been told before that this can be corrected by hardware modifications. This is presumably old news - but can anyone provide details of the modifications?

Thanks.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

What is Midi Maze you may ask? It is a game where all participating computers are connected in a ring through Midi cables. In this 3-D game the player is represented as a happy face. The goal is to shoot the other enemy players to gather points, and after a set number of points have been accumulated, then you win.

I am hosting such a party on Saturday, January 22. Festivities will begin sometime around 5:00 and will end sometime Sunday morning.

Please email me at bmich@cs.utexas.edu if you have any questions. All are invited. Hardware required is at least a 520ST, monitor, joystick cables, disk drive, AND TWO Midi Cables.

See you in the halls...
Brian,

>>Is there a better command line shell for TOS, of the 'csh' flavor?

>You may try the Okami-Shell. Contact <wr@bara.oche.de> for more
>information.

While I don't want to degrade Wolfram's fine piece of work (I've used
his Okami Shell for a number of years), here's a caveat:

As most of the Okami Shell's commands are built in, they can't be com-
fortably used in a multitasking environment, i.e. MiNT. Doing a 'cp <file1>
<file2> &' will run, albeit not in background. For this reason I changed
to tcsh on one machine. About 4MB of disc space is now taken up by all those
commands the Okami Shell includes. Well, not quite, I counted the GCC distri-
bution into those 4MB.

If you don't need multitasking and don't plan to need it in the near fu-
ture :-) , then the Okami Shell is for you. It is relatively small, consi-
dering the wealth of U**x commands it comprises, and it works nicely together
with GEM programs, as it has an extra shell function for invoking those .prg
files.

The PAK68/3 is, among others, available from

MW electronic
P.O.Box 2168
D-53639 Koenigswinter

Prices they told me on the twisted pair are, as far as I can remember,
DM555.- for the kit including a used MC68030 and a used MC68882 (32MHz),
DM120.- for the PLCC to DIL adaptor, and DM175.- for a patched TOS3.06
(not 2.06). In the pipeline is a Fast-RAM-board, which, to MW's claims
will be faster than the genuine TT.

As usual, I goofed. That is the demo of Papillion. There is a demo version of Papyrus somewhere, I have it at home. It is on one of the .de sites (read : German), but if you can't find it, let me know, and I'll post it up somewhere. Script 3 is mighty nice too ....

Karl.

Hi,

I am looking for a utlity to get files from my friend's Atari ST to his
DOS machine. Anyone know how I can do it?

Thanks in aadvance

This implies there is 'a right to software'. This (at least in the UK) just does not exist. Just because you once *could* buy the software, doesn't mean that if it is withdrawn from sale you can obtain it anyway you like.

A extreme case of this would be that sometimes a software company buys out another one in order to shut it down and *stop* the selling of a competing product. The software is therefore no longer for sale. The original company may no longer be trading, but somebody still owns the copyright, and they don't owe you anything, especially not free software.

OTOH most of the time the distribution of unmarketed software doesn't cause a problem as the copyright is owned by somebody who considers it of no value, or at least doesn't mind. Doesn't make it *right* though.

Roland.

I found a little "hardware-patch" by Juergen Meyer to get 38400 baud
on every ST/STE without any special chip - just a 74LS74, four wires to
the MFP and a switch ... that's all !
The only problem: You have to use the switch to choose manually between
fixed 38400 and "normal" baud rates :-|

But its _very_ cheap and works fine in my 1040STE (average speed is more
than 3000 cps with a 14.400 baud/V.42bis modem :-)).

Is anybody interested in this "patch" ? I can translate the document and
post it here.

You mean you spent all that money on it, but now you can't use it? Pretty distressing. Tabbing seems pretty simple to me. Powerful too. Then again, I've only use it seriously for a short time, and tabs aren't all that common in my work.

Compared to PageStream, Calamus is UNBELIEVABLY faster. A page that takes PageStream 10 minutes to Create and Print, Calamus does in 20 seconds. And screen updates in Calamus are actually CACHED... PageStream hasn't even heard of the term.

The only gripes I have with Calamus is that I have more fonts for PageStream (but plenty are available for Calamus), and that some things take a few more mouse-clicks than I like (but I'm sure this will change as I become more familiar with the keyboard shortcuts).

I had trouble with Mike-Net on TT<->ST too though, and the TT has no MIDI
problems. I assume it is a timing bug in MikeNet. OXYD-2 works fine,
and it uses MIDI cables, at I assume a high throughput.

FYI, it was changed because .z was already used by pack, another compressing utility (which GZip can uncompress too).

|> P.S. Somebody recently asked if .tgz was tar+Gnu Zip, it is, and Gzip
|> will recogize this and untar it automatically.

That is wrong, GZip can only *uncompress* it, you have to feed the ouput to tar youself. But GNU tar can handle it by optionally filtering the data through GZip via a pipe, which also works under MiNT.

1422. MEGA STE

Newsgroup: comp.sys.atari.st
Date: 1994-01-21 10:51:59 UTC
From: lonsdale@acri.fr
Message-ID: <1994Jan21.105159.16650@acri.fr>
Source record: 194600

I have just bought a Mega STE with TOS2.5.

It seems to be causing me some problems.

Is this equivalent to TOS2.05?

How can I get an upgrade to TOS 2.06.

Are there any other problems I should know about?

Are there any other solutions?

Thanks
Andrew

You can't put a military drive in a Panther. A panther requires a class 6
hyperdrive just to move it. You need a class 8 to get a decent range.
Then again, my Panther (ZQ-733) has 100 shield generators, 4 20MW beam lasers,
8 navel missiles, Naval ECM, Energy Bomb and is virtually invinceable in
combat with a class 8 hyperdrive, so why do you want a military drive?
I still have 500tons of cargo space too.

> class 4 drive for most purposes (add hyperspace cloud analyser/athmospheric

---
Ah, my panther is invulnerable to you. I have enough sheilds and an energy booster that a 4MW beam laser can't get through before it over heats, and they recharge before it can fire again. Although if you've got a cooler...
Then again, my turrets both have 20MW beams, and I'm expert with them...

> Bugs in the ST version:
> - Bulletin Board doesn't scroll. Fix: Wait till midnight
> - Frontier always wants to load the commander file from drive a: after
> start and will bomb out if there is no disk. Fix: obvious
> - Hyperspace could analyser bombs out if you analyse your own cloud.
> Fix: Be careful what you check and complain to gametek/konami

Add to these:
- bottom turret doesn't work on Boa freigter - trying to use it causes the top turret to fire down through your ship... BOOM!
- there is a station in the Riedquat system called 'La soeur du den ham' the name is too long to fit the BBS display, causes screen corruption.
- If you head fast at a space station and hit max star dreamer you can fly through the station with only minor damage - helpful sometimes.

: than that, the game is fantastic.

It is not a bug, it's perfectly normal. :-| If you're playing a game over a long period of time eventually it will reduce the amount of times it asks you and will even stop altogether. So if you're playing a long game which you save every time you finish a playing session and reload when you start playing again it should stop after as while. However, if you like loading up the game and playing it for an hour (without saving) then you'll just have to get used to it.

It is an excellent game; five years good work by Braben.

After advertising for months that Lattice C 5.60 was available when it wasn't, it *does become available. We only had to wait 4 extra months because thy decided to rewrite the manuals and then couldn't organise getting the stupid things printed.

Now they are distributing packs which don't install properly because the labeling on the disks got mixed up.

I know the LC5.60 isn't that expansive but for a company that has got such a good reputation they really don't inspire me to want to buy anything from them again..ever.

They will, ofcourse, supply new discs but they really should be getting it right by now.

DAMN.

>Patrice LACOUTURE

OK, I've followed this thread for a while, mainly because I asked a similar question a while back. If ICD don't allow their software to be obtained on the Internet via anonymous ftp, and I cannot get to their BBS or GEnie (I'm in the UK and without a modem), then is it acceptable for me to say "will some kind individual with this software send me a copy please"?

If so, then "will some kind individual with this software send me a copy please?" (I'm asking because when I went to TOS 1.06, my desktop.acc complained that it wouldn't run with this version of TOS.)

Cheers,

Yes, it is (and apparently, since it's TOS-legal, it's Falcon compatible as well - haven't tried yet) And it only flickers significantly in 4096 colour mode. 512 colours is pretty well rock steady (and if you turn the detail down from V. High, it's fairly fast too) Go and GET IT. You won't be disappointed.

Cheers

I'm very surprised to hear of your problems. I got 5.6 several months ago direct from Hisoft and apart from a bad disk, it installed fine. The manuals are a different kettle of fish though. Awful. Perfect binding is a mad thing to do with programming manuals. I still use the old set I have as the new ones are a pain to use and very badly laid out.

Jeff, Atari has no email address, per se, as they have no official presence on the net. Some Atari employees used to check in here ocassionally on their own time but never in an offical capacity and I haven't seen anyone here in months. Your best bet is to contact someone at Atari through the internet gateway to GEnie, which is the official network for Atari. For example, you can send email to Bob Brodie on GEnie by sending to bob-brodie@genie.geis.com . But be advised that Bob is no longer 'just' Head of Communications but has taken on a whole lot more of new responsibilities, many of which are Jaguar related, sad to say.

As far as any of the Tramiels reading this thread... it ain't gonna happen. :)

Format a 720K disk on the ST with Fcopy 3.x. If he's lucky, he could
read the disk on his 1.44MB DOS drive. Sometimes the 1.44MB drives
have problems, sometimes not.
Don't forget to format the disk with 9 sectors/80 tracks, but the clue
is the MS-DOS bootsector on it. Otherwise MS-DOS couldn't read the
entire disk (messy dos once again).

Only the 720k (Double-Density) versions, though (assuming it's a bog-
standard ST). And you forgot to say that the ST can write to disks
formatted on a Mess-DOS machine.

Cheers, Steve

GBell 1.0beta has been uploaded to a.a. GBell - or GEM Bell - is a resident program that plays off a sample at various AES calls. Like, singing "Halleluja" every time you open a window or "Ah! I see you have the machine that goes BING!" when the fileselector appears. Full documentation is enclosed as well as four samples to "get you started". Should work on all STEs, TTs and Falcons. (Tell me immediately if it doesn't)

>I'm seriously impressed with it. A very full implementationm with X and full man
>pages, utilities and compilers. Am I right in thinking this was the BSD source
>that became PD a couple of years back?

Correct. Here's the current naming convention:

1. 386bsd -- the original, currently at 0.1
2 BSD/386 -- commercial version w/commercial support
3. FreeBSD -- Improved version, targeted at stability on 386, 486
4. NetBSD -- Improved version, targeted at portability and 4.4bsd conformance

This is of course an oversimplification ... check out the details in the comp.os.386bsd.* newsgroups.

4 is at version 0.9, but I do not know what version the Amiga and Mac ports are based on, and I do not know the state those ports are in.

2, 3, and 4 are derived from 1 and are thus in effect 4.3bsd-based OSes for 386 and up. 3 and 4 are both free, do not require license fees, and come with complete source code. OSF/Motif costs money, and is available in binary.

Both 3 and 4 are very usable, are distributed on the internet, on CD ROM, and via "shareware" sellers.

>How far away is a TT/falcon port?

I do not know anyone working on such a port. I cannot honestly say that I will ever sit down to do it, but I'd like such a port very much. I do not know how many [divergent?] changes the Mac and Amiga people made.

Believe it or not, this was the solution. With the original SIMMs in my MSTE I would get the video shift virtually every time I used the computer even with wrap_fix installed. It happened sporadically, sometimes even when idling on the desktop. Since replacing the SIMMs, I have not had occur again.

I don't mean to imply that my MSTE won't shift by fiddling with the registers of the video chip now, it just doesn't do it under normal every day use like it did with the original SIMMs.

1461. Moron of the Week

Newsgroup: comp.sys.atari.st
Date: 1994-01-21 17:53:44 UTC
From: ewj8218@u.cc.utah.edu
Message-ID: <2hp4r8$o39@u.cc.utah.edu>
Source record: 194563

So how about a bit of fun, eh Atarians? Let's start a little game called Moron of the Week. Every week we nominate a particular uninformed member of the press who says something particularly moronic about issues involving Atari. More specifically the Jag since it has the most press lately. Well anyway, even if I don't start a trend, I still wanna put down this guy. Where's a better place to do it? :)

My Nomination for Moron of the Week:

Dennis Lynch of the Chicago Tribune, in his article on WCES, yesterday, the 20th.

"Another new machine making noise was the Atari Jaguar, a 64-bit cartridge game system that is on sale on San Francisco and New York but that won't hit Chicago shelves until next month. It will retail for about $200. We'll review this system, which soon will have a CD-ROM attachment, in depth in February.

But the dark-horse surprise of the show was the Amiga CD32. This system has the most impressive specifications sheet of any of the new game machines and even has the ability to play FMV (full-motion video). From what we saw, it's as good a game machine as the Genesis and as good a multimedia machine as the $700 3DO. The CD32 is also much less expensive than the 3DO at $400."

His description of the CD32 as having "the most impressive specifications sheet of any of the new game machines" is really what got him my nomination, however he also insisted on including a speel on violence in videogames just so he could be part of the newest moronic political trend, the crusade against videogame violence! Puhleeze.

"Speaking of carnage, one of the more depressing trends of the show is the video game industry's continued fascination with violence and mayhem. Titles such as Lethal Enforcers (Konami), Total Carnage (THQ) and Maximum Carnage (Acclaim) speak volumes about about the lack of imagination-and social consciousness-of many firms."

Congratulations, Mr. Lynch!

In all fairness to Mr. Lynch, he did say he'd be reviewing the Jag in detail later. We'll see how that review turns out.

>to get around the emulation problems some how tell me how you did it.
>It's rather frustrating to buy a new printer and find you cannot fully
>use it.

The bubblejet driver from the Calamus 1.09N package works perfectly well
with the BJ-200 in native mode. Just flip the "AGM" jumper on the printer.
Only the margins won't be quite right - but adjustable margins can be done
through the printer driver "compiler" available from DMC.

btw, all Calamus drivers are (C) DMC, and may NOT be shared between users.

From: sourada@iastate.edu
Message-ID: <sourada.759179288@vincent2.iastate.edu>
Source record: 194564

Strange problem with NVDI here: whenever a ^G gets printed, either a bit of garbage is put on the screen, or my system bombs.

I've tried all kinds of configurations, and I've tried taking everything out of my AUTO folder except NVDI (and I don't use acc's...). I've also tried re-installing NVDI many times. It always insists on bombing on me.

My system is an American 1040STe with 4M RAM, NVDI 2.5, ICD's hard drive driver, TOS 1.62.

Anyone have any ideas?

Thanks,
Steven

UUps... I think, there is something to do ....

And in the new version there will be an englich resource. For the last
version I have one too, but I didn't place it on ftps.

KN> on Mac software drivers for CD-ROMs is copying the directory structure
KN> (not the files) onto your hard disk for cacheing purposes. This is a
KN> great idea since it is MUCH faster to find a file on the CD. CD drives
KN> are very slow. However even this scheme can take up a few meg on your
KN> hard disk.

I've noted when using various CD's on a PC, that some installation routines give various options for setting up certain data on the HD --anything from the odd MByte upwards of 20-30 MBytes. The smaller values obviously save HD space, but the reason for the larger is to speed up loading and access in various ways by copying out more of the viewer software and overlays (multimedia) and providing large data buffers. The unit's behaviour does rather suggest that the directory structure is also copied out onto the harddisk.

As multispin CD-players get more common and access times go below 100 ms (I recently saw a new Nec 4x drive rated at <180 ms, 600 kbps), this need for extensive harddisk "shadow copies" of CD may eventually go away...

I have an st so for me this discusion is completely
hypothetical. What is so great about linux!? I know very little
about this, but it seems like it would be a lot easier to port BSD,
and more useful to port mach. Perhaps mach + mint .95 would allow you
to have good tos emulation from within unix. Why is it that every few
months I see a thread about porting linux, but I have never seen a
thread about porting other unix-like systems? Is linux faster than
the others? Is it more stable? Is it better (or more often)
actualized? What does "It's FREE and often actualized" mean exactly?
What are linux's advantadges over bsd-386 mach386 and hurd on pcs?
In short, why linux?

Curiously,
Jason

I have to agree with you, I much prefer the 'old' ring bound manuals, easier to leaf through and also much easier to find the information. Also no mention of the Speedo bindings except in the 'Modern Atari System Software' book. Has anybody tried the profiler programs, lprof and lstat?

>the honest people - a way to get it legally.
>
>Remember: This copying thing is just when the program isn't supported and
>supplied anymore.

Why must the original authors be obliged to sell it to you?
Perhaps there was a very good reason why they shouldn't -
or perhaps they just simply don't want to be in that business
anymore. Why does that mean they must be willing to give away
their property? Suppose that they someday decided to
rerelease the product, or to incorporate large portions of it
into another product. In some places, failure to
take action against copyright infringement could adversely
affect the company's rights to any subsequent developments.
Or, suppose there was a serious problem with the product,
resulting in a large potential liability. Should they allow
themselves greater liability exposure by turning a blind eye
to piracy?

Yeah, it's not fun when a whizz-bang product is withdrawn from
the market, but if you didn't catch it the first time 'round,
well, that's tough.

What I usually do is format to 9 sectors 80 tracks on the DOS machines.
FORMAT/N:9/T:80 from memory. Either that or buy preformatted (IBM/PC fmt)
DSDD disks (eg Datalife Verbatim). Such disks work prefectly in an ST.

This way you don't have to "be lucky". It works. Every time.
My first experience with ST "DOS compatible" formatters put me off
investigating further...

Are your friends machines close together? If so it might be less
hassle to connect the serial ports and transfer the files like that.

Glad to hear that. I've ordered my copy today, but won't get it until the
end of next week :-(

I'm definately likely to play it more if it works from the hard disk. Most
games I buy I can't be bothered to load up after a week or 3.

As for speed, I've tried the demo on my MSTE. Looks fast enough, and that
was with all my usual patches/acessories loaded, although whether they were
getting an CPU time is anybodies guess.

:-)

Roland.

Personally I use a Cobra MK1 with class 3 mil drive and three shields along
with 1MW laser and cooler. I prefer 1MW because I can keep it permanently on.
You can also dump radiocatives safely (as long as you are not near a station).
Also the prices in disputed systems are rather high; only problem is
if you need the money you may not have good enough weapons, if you have good
enough weapons then you probably don't need the money ...
Has anyone seen anything 'secret' or odd devices available yet ? I'm
only up to competent+seargeant-major (at which point the military offer you
assassination missions), so perhaps that's still to come.
Steve.

This is a well known NVDI bug. The only solution is to relace the
bell sound with a sampkle, or possible turn it off.

You should mail wilfried_behne@h.maus.de (the author) and
complain.

Actually, Apple Records DID take Apple Computer back to court after Apple released MIDI Manager. They ended up settling out of court for several millions of dollars. Apple Computer thought their litigation insurance would pay for it, but the insurance company wouldn't pay for it because the policy doesn't pay for out-of-court settlements. So what did Apple Computer do? Well, last I heard, they were THINKING about suing their insurance company (big surprise, huh? <grin>), but I don't know if they did.

You should check with whomever distributes ICD products in the U.K. In the U.S., ICD will also send updates via mail (for a small fee).

What exactly do you mean when you say printed? If you are writing a program
and it uses v_gtext, be aware that that function plots _all_ ASCII codes
without interpreting them, not just ^G.

If you mean something else, this is the first time I'd heard of anything like
that.

>
>Pads
>
A friend of mine has Frontier (I can't afford it right now) and here are a few
tips from him:
Stuck in the spacestation syndrome: when you have just changed drives (or ships)
and the doors of the station open, and you just sit there: You have probably run
out of internal fuel. Activate the autopilot, (with the current SS) selected,
and it should land you again.

Auto-refuler is notoriously unreliable. Instead of refuling when you have space
for fuel, it refuels when you run out. If you calculated the jump exactly,
to have more space for cargo, you will get a nasty surprise when in the middle
of breaking to land in the next system, you get the message "Internal fuel
tank empty" and the autorefuler doesn't work, because you don't have any fuel
left on board anymore.

Here is his receipe for refueling from a gass giant. Get the fuel scoop and
cargo scoop conversion. Select autopilot for the neares gas-giant (this is
not allways the outermost gas giant). Activate autopilot. When autopilot
reports "Arriwed in vincinity of target", change the view to look back,
rotat the ship until you see the planet in your sights, switch to manual
controll and select a speed between mach 10 and % (5000-10000 kmh). The scoops
will activate when you reach ALT 0 (THIS IS ABOVE the normal 50km atmosphere
count). Fill your tanks, including internal. When you are full, blast off
at max power and decent time rate.

(Does it show I hand around his place a lot lately?)

I do think this is a bit point less, it was sent all over the world by
a well known Atari man via Z-Net and other Network feeds, Fido etc..

There is little point in shutting the gate after you have let the horses
out...

The same happened to Ataries Check Disk 3 that was posted on GEnie, that ended
up all over the world and is still on many Archive sites...

The point is never give software away to people you can't trust....

Mind you I have had people come into my house and copy software behind my
back..

> multitasking..

Geneva's "multitasking" is much like Windows' "multitasking"... it can
only switch between processes when they make a call to the AES.
Compressors won't make many calls to the AES... the only ones will be
when they update their little display... and then it's back to hogging
the system. If you want real multitasking, you have to use MiNT.

By all accounts Geneva will support MiNT some day.

I don't think it would be. *Painful* probably, but I doubt it'd be
"nice"... X would CRAWL in 15-bit colour on the Falcon (essentially the
same speed as a '385sx/20... ow! _Windoze_ is too painful on such a
machine!)

It might be more reasonble on a TT, but not much.

I think we need to face it. If you want to run Linux, a '486 is your
best bet. :-\

The newest version should be 1.50, and I think it is at least at
atari.archive.umich.edu, by the name utopus15.zip in atari/Games/.

Talking about atari.archive, I just tried ftp:ing there, and
everything went fine until it asked for the password. I gave my e-mail
address, and it said something like "Can't set guest privileges" and
didn't let me do anything. Has anybody else had these problems?

Are you sure about that? AFAIK non-pro drivers only work if you have
an ICD ACSI->SCSI converter connected to your machine. You can't do that
with a Falcon.

Unless you have a hacked version of ICD drivers. In which case, serves
right.

In <2h9h2k$8pu@golem.wcc.govt.nz>, Steve Wells writes:
> What actually is the difference between pre-emptive multitasking and
> whatever it is Geneva/MTOS does!?

MultiTOS does pre-emptive multitasking because it uses MiNT as it's underlying operating system.

"Pre-emptive multitasking" means the system can interrupt a running process at any time; the multitasker (in our case, MiNT) knows when other programs need to run (or should be given a chance to run), and gives them a chance.

"Co-operative multitasking" means the system can only interrupt a running process at certain times. For example, the "multitasking" present in all STs (ACCs running with programs) can only switch processes when the currently running one is waiting for an evnt_multi() call (or evnt_keybd/evnt_timer/etc). If I understand Geneva correctly, it can switch processes any time one of them makes an AES call (since it replaces the AES)... TOS programs running in the Geneva TOS runner program can be switched when they're waiting for keyboard input, but only then.

The biggest win for pre-emptive multitasking (such as found on the Amiga, any Atari with MiNT loaded, UNIX, OS/2, Windows NT) and co-operative multitasking (such as found on the Mac, and mostly under Windows) is that under a pre-emptive system, it's very hard for one program to hog the system... no matter how hogging a program is (ex, a ray-tracer that's running for days) other programs will always get a chance to run (usually called a "time slice"). On a co-operative system, it's _very_ easy for one program to hog the system, preventing other programs from running. An example of this would be trying to print under most Windows programs; nothing else gets a chance to run (which is incredibly annoying, even with small documents).

Most people are wise enough to see the benefits of pre-emptive multitasking. Those people that claim to not need it (or to not want it!) have probably never used a system that had it, so they don't know what they're missing.

Uh, putting:

INIT=c:\multitos\gem.sys

in your mint.cnf turns your MiNT kernel into a MultiTOS kernel.
Remember to substitute the real path on your system for "c:\multitos\".

Doesn't it?

On a _very_ busy day, I see ~100 new messages in comp.sys.atari.st; I
bet if you did an official RFD/CFV cycle, you wouldn't get enough votes
to re-organise the hierarchy. There are just too few Atari users these
days...

Mupfel (part of the Gemini 1.xx distribution) might be what you're
looking for... I haven't checked out the new Gemini yet, so I'm not
sure how well it works under plain TOS.

> PC Ditto?

Not likely, due to the amazing slowness of PC-Ditto... On a regular ST
it emulates a 0.3Mhz 8088 (or was that 80286?)... if you were very
lucky, it'd emulate a 0.6Mhz <whatever> on your MegaSTe; I doubt that's
fast enough to feed _any_ FAXmdoem enough data to keep the transmission
going.

I had this problem as well - it fixed by replacing the TOS, i use TOS 2.06
now and had never problems.

1513. Falcon keyboard problems...

Newsgroup: comp.sys.atari.st
Date: 1994-01-22 15:12:45 UTC
From: pd@mbuc.bio.cam.ac.uk
Message-ID: <1994Jan22.151245.28976@infodev.cam.ac.uk>
Source record: 194513

My Falcon is having a slight problem at the moment...

The keyboard is only half working.
The keys from escape to about 6,t,g,v work ok. Everything past that produces random characters or nothing at all. I had a similar problem on my ST when the other half of the keyboard stopped working completely. I never did work out why, it just went back to normal again.

So, if anyone has any ideas please e-mail me!

BTW another thing (or two) I have noticed is that the first few times I changed video mode to ST compatible I had the ST modes ok and also TT modes greyed out. Now it has gone.
The last thing is occassionally when I reboot the first screen where the fugi symbol appears is in a unusual rez. A few reboots later it goes back to normal.

I have tried resetting the NVRAM, switching the machine off for days, in fact, just about everything I can think off.

Help!
Phil
(E-mail pd@mbuc.bio.cam.ac.uk)

Those who bought a TT to get TT performance! Do you consider MiNT a
feasible system? It's dead slow and very insecure.

> And am I suspecting rightly that most of those opposing a TT group don't
>have one?

I've got a TT and like to think of it just as a quick ST, i.e. a -tos-
machine. Hence the proposal to change the name of the groups to
.tos. instead of *.st.*, all similar to the way one would look at
other operating systems: macintosh people are not thinking about
different groups for their quadras, are they? MS-DOS people don't have
groups XT, AT, 386, 486 and Pentium, they've got comp.*.msdos.*, so we
should have comp.*.tos.*!

Probably because Apple (records) were scared of the size and experience
of Apple (computer)'s dedicated 'sueing department'. (From what I hear
every now and then, at least half of Apple (computer)'s time should
go into sueing other manufacturers).

Use the VDI call vs_color. If you are doing other thing than plain
drawing, such as copying pieces of graphics, you'll have to get colour
conversion tables to know the right VDI colour indicies. But as long as
it's only 16 colours, you can get them from any book on the ST.

Info on how to manufacture a colour conversion table can be found in one
of the 1992 issues of the German magazine ST Computer.

I would reccomend that you use Gnu zip instead of the Unix compress utility.

This can be found on atari.archive.umich.edu in
/atari/Gnustuff/Tos/Othergnu/gzip107st.zoo

If you have a TT or Falcon, you can use gzip107tt.zoo

AE.

>Waters kick your dog or something? :)

No, he didn't, and there isn't more at work here. I've never talked to the guy nor have I ever met him.

He puts out a magazine and his name is all over his work. He *is* Current Notes. Am I not allowed to critique his work? People critique mine all the time and the "only" thing I do is write; I don't even do the editing or publishing.

>But let's be realistic here... First of all, CN started life as a user
>group newsletter or more correctly, a newsletter for a consortium of
>Washington D.C. area Atari user groups. In the many years it has been
>around, CN has grown to become a separate, commercial enterprise yet it
>still retains much of it's user group heritage (good and bad).

I know it used to be a user group magazine. And I suppose that since it has that background, I'm supposed to expect less from it? Funny, Joe Waters doesn't think any less of my subscription money. Interesting how that works.

I'm not the only one who thinks that CN needs improvements.

>Most of the articles in CN are written by users. If they don't like a
>piece of hardware or software, they make it very clear and, in my
>experience, very little editorial excising is used. They don't sway to
>their advertisers.

I think there are some BIG misconceptions about Atari magazines.

I've written for almost every domestic Atari magazine out there: Atari Explorer, Atari User, Atari Advantage, Z*Net, Atari Explorer Online, and even STReport -- there are probably a couple of others, but I can't remember them right now.

I don't understand this "sway to their advertisers" bit. All the reviewers get a software or hardware product either from the editor or they buy it themselves, and they write what they think about it. The advertisers have nothing to do with it. The editor doesn't say, "Well, Company A gave us $5.00 this month for advertising. That's the most we got in a long time from any advertiser. Please make your review very positive and flowery." Sorry, but that doesn't happen. I'd write a review for Z*Net, AEO, or STR in the same manner that I'd write it for any of the

subscription, paper magazines.

It goes like this: no one likes to review a sh*tty piece of software. If we know something is really going to suck, why write about it? Everyone else probably knows it sucks too, and writers' valuable time can be spent writing about something else. If the product has been talked about a lot before it's released and we know it's bad, we'd review it because it's popular, and I don't think any reviewer would give it a positive review. It doesn't look good for the reviewer for one thing -- if he likes it, and everyone else hates it.

And you say CN articles are written by users. So, what am I?
Chopped liver?

Everyone who writes ST reviews is a user. What else could they be? No one writes ST reviews for a living.

>Unlike other magazines, CN lives up to the 'Current' aspect of its name.
>They do not suffer with long lead times as other Atari magazines have
>and still do.

Maybe if their lead time was a little longer, they could put out a better product.

>Each to their own, Ed. :)

Yup. You got it. :-)

Hi All,

I've got some questions regarding the usage of
Atari's hard disk drivers and their features...

Some background: I've got a Mega STE with TOS 2.06
and am currently using ADHI 5.00 and HDX 5.00
I've recently downloaded HDX 503C, HDX 504,
ADHI 605C, AHDI 606, and ADHI 6061.

I'd REALLY appreciate ANY answers to the following
questions. I know that there are others out there
with similar questions too...

1) What is the "best" ADHI and HDX to be using?
Are there any versions to stay away from?

2) I assume it's ok to use the latest HDX with
my MSTE, but how about AHDI? In one of the
readme files, they mention the Falcon but not
the MSTE. Is AHDI 6061 Mega STE friendly???

3) What are the differences between AHDI 606
and 6061??? (ie: was something in 606 broken).
There was no readme with AHDI 6061.

4) Assuming I'll move up to ADHI 6061 (or whatever),
how do I do it? Do I just use HINSTALL to
de-install the current driver and install the
new one? Do I need to reformat or anything,
or is it as easy as copying SHDRIVER.SYS to
by boot partition?

5) What's the relationship between SHDRIVER.RAW,
SHDRIVER.SYS, and AHDI.PRG? For a given version,
all three files are the same size. Are they
just renamed versions? It's my impression that
HINSTALL uses SHDRIVER.RAW to create a SHDRIVER.SYS.
I'm not sure what ADHI.PRG is used for...
The reason I ask is that AHDI 6061 just comes with
ADHI.PRG (ie: know SHDRIVER.RAW).

Thanks in advance to anyone who can help. I'm kinda
living on the edge 'cause I haven't backed up my
hard drive yet (I know, I know) and I don't want to
trash my drive when upgrading...

VIJ...

> this is the case. Anyone?

Your friend is talking BS, luckily. ;-)

I wouldn't fancy copying a 600mb CD-ROM onto hard disk. ;-)

Presuming you can get MetaDOS (Atari's CD-ROM driver s/w) to work then it just acts like a normal (but read only) drive, ie. you should be able to get a drive window with files, up on your desktop. That's how I understand it anyway.

IIRC there is a bug in the MetaDOS 2.0 drivers that prevents you from coping files over about 8k, unless you have an alternate copy program that reads in smaller chunks anyway. Not sure if 2.2 fixes this, I would hope so though.

If that's so, then a lot of people in Europe are using hacked-up versions
of the ICD software. AFAIK, virtually everybody uses the ICD software for
SCSI drives on TTs without the ACSI interface being involved.

1539. UK ST Magazine

Newsgroup: comp.sys.atari.st
Date: 1994-01-22 19:55:26 UTC
From: Paul.Civati@mettav.royle.org
Message-ID: <759349814.2@mettav.royle>
Source record: 194409

[Although strictly speaking commercial advertisements aren't allowed on]
[UseNet I thought I'd post this as it may be of interest to readers...]

ST APPLICATIONS is a monthly magazine consisting of 60 well-produced A4 pages which is normally obtained through subscription. Each issue costs 2.50 UK pounds or 24 UK pounds a year (2 UK pounds each).

The editor is Paul Glover who runs the ST Club, one of the biggest ST PD libraries in the UK and well experienced in publishing software and books.

ST APPLICATIONS is the ONLY serious, well written magazine for the Atari range of computers in this country and well worth the money. All writers are freelance and Atari computer owners of some years experience. The ST, STE, TT and Falcon are all catered for.

Further details, a sample copy for 2.50 UK pounds and subscription can be obtained from:

The ST Club
7 Musters Road
West Bridgford
Nottingham NG2 7PP
England
Tel: +44-602-455250
Fax: +44-602-455305

ST Applications can be bought from Toad Computers in the US who will take subscriptions, from Paragon Computers in Australia and ABC in Oslo.

The ST Club also has a distribution agency which has a Canada office:

Worldwide Magazines
Unit 19
Chelmsley Wood Ind. Est.
Waterloo Avenue
Chelmsley Wood
Birmingham B37 8QD
England
UK Tel: +44-21-788-3112 Canada Tel: +1-519-539-0200
UK Fax: +44-21-788-1272 Canada Fax: +1-519-539-9725

SUBSCRIPTION RATES:
UK 12 issues - 24 UK pounds (plus 6 Disk Mags - 36 UK pounds)
Air Mail Europe - 27 UK pounds (plus 6 Disk Mags - 40 UK pounds)
Air Mail World - 37 UK pounds (plus 6 Disk Mags - 48 UK pounds)

Subscribers get discounts on ST Club software, accessories and hardware and 20% off PD and Shareware disks (1 UK pound each).

A Disk Magazine is also offered which contains a compilation of the latest PD software. It is bi-monthly and not a magazine.

Cheques and postal orders (crossed) drawn on UK banks should be made out to SIMPLE LOGIC and CO. (Overseas customers please ask for ways to pay), sorry no credit card facilities at present but may be due soon.

Back Issues cost 2 UK pounds each, 1.25 UK pounds each for 3 or more issues.
Issues 1 to 12 - 9.95 UK pounds, 13 to 24 - 9.95 UK pounds.

Also a 3-issue trial subscription is available for 3 UK pounds.

GUARANTEE:
If at any time you wish to cancel a subscription, just write and the unused
portion of your subscription will be refunded by return of post.

1540. Commodore 1084s Monitor

Newsgroup: comp.sys.atari.st
Date: 1994-01-22 20:02:13 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <1994Jan22.200213.13498@bradford.ac.uk>
Source record: 194542

I was recently at a computer show and there was on sale a 1084s monitor which I heard somewhere was a rebadged Phillips CM8833mkII monitor. I asked the guy whether it would work on my STE ok and he told me that it would work fine with the right cable. I bought it and went and got a cable for a phillips mk2 from another stall. When I got it home I found that the horizontal sync had gone so I got worried thinking I'd bought a dud monitor. However after buying a new cable it seemed to work fine. The cable I replaced it with was one for a mk1. I recently got hold of an amiga but I have bought two cables for this so far and the horizontal sync has gone on both of them. These two were both for a mk2 but I'm not sure if this makes any difference. Has anybody got any ideas?

Cheers

Paul

From: boyd@gauss.math.fsu.edu
Message-ID: <2hs4ie$979@mailer.fsu.edu>
Source record: 194451

I managed to order NVDI for $40 from Toad Computers (1-800-448-TOAD). Big thanks to all that took the time to inform me of this great deal (repeatedly :-). The version for sale at this price is NOT the latest version, but Toad informs me that the major change in the latest version is Falcon compatibility. The latest version sells for $89. They do have a few older ones left for $40. If you have an ST, STe, or TT it should work fine.

I had a similar experience, but my problems stopped when I found ps2form.tos.
It is an ugly TOS program, but it works every time for me (and has for at
least 4 years). The docs claim that it was designed to produce disks that
would work on PS/2's (early PS/2's were extremely picky about floppy formats).
It is available from atari.archive.umich.edu.

All my modems send the text "RING" to the computer when a ring is detected.
You might have to configure yours to do this, or it might be too old to
have this feature. Anyway, my point is that you would establish a serial
connection to the modem and look for "RING" or the numeric code equivalent,
depending on the way your modem is configured. Thus, if you can get ahold
of some source for any terminal program (or even instructions on how to use
the built in vt-52 interface) you should be in business. Hope this helps.

] a bit, especially on the spaceport shots - is the game like this as well?

Well, it works from a RAM-Disk, it's only 1 file.

I play it in Low-Detail, 512 colors mode, and it only flickers very
slightly, in some places (You don't notice unless you really try), this
is on an STFM, although I very much doubt an STE makes any difference
to the game! (Nothing in the manual...)

>INIT=c:\multitos\gem.sys
>
>in your mint.cnf turns your MiNT kernel into a MultiTOS kernel.
>Remember to substitute the real path on your system for "c:\multitos\".
>
>Doesn't it?

You also have to recompile the kernel with MULTITOS symbol defined.

My mint.cnf actaully looks like this:

```
# multitos.cnf
# Last Modified on 6/23/1993 19:10
# ====================================================================
# Start up the GEM Desktop

GEM=C:\MULTITOS\GEM.SYS
```

BTW I've cured the problem I was having. It was all due to having a *second* copy of mint.cnf in mint directory. MTOS unfortunatly checks the mint directory before the multitos directory, hence the problem. MTOS 1.04 has this feature as well, but seems to be able to guess where gem.sys is.

I haven't worked out all the intricacies of this situation yet, but I'm not *too* bothered.

Also I've found that MTOS 1.08 doesn't like its .XFS drivers at the root level. It picks the up when in the multitos directory. Unfortunatly it doesn't like my ICDCDZ2.XFS CD-ROM driver. I know alot of people have had trouble with this, but its always worked fine for me under MTOS 1.04.

I've heard that the .XFS driver support is broken under 1.08. Anybody else come across this? Also I've had no luck patching my 1.08 code to 1.09. The diffs are called something like:

diff1819.txt
diff1819.spp

and came in a file called:

diff1819.zip

I've tried copying them into my compile directory, but don't really know how to use 'patch'. I've tried all the obvious:

patch diff1819.txt

patch *.c diff1819.txt

patch < diff1819.txt

Only the last does anything remotely sensible, but this fails at the first 'hunk'.

Anybody know where I can get pre-patched code for 1.09, or how to use patch properly, and where I can ftp a known good version from?

Thanks

Roland.

I found a surplus store today that had Moniterm VY1000 19" mono monitors
for $100. They have a 9 pin "joystick" connector on the back and come
with some manuals, etc. They say a UNIX driver is needed.

IS this the same monitor they sold for the ST? Is there any other hardware
needed for the ST to drive it or is the software driver all that is necessary.
They have 3 monitors so I would like to hear from people if they know
anything about this - I could probably send someone else a monitor if they
really wanted one. Any help would be greatly appreciated - $100 would
be a real bargain for a 19" monitor.

Thanks,

I finally got me an attenuating cable. Thing is, now no sound comes in... sound comes in if I remove the attenuator cable. I just got one at radio shack. Heres what I'nm doing:

CD Player - RCA to 1/8" jack, female 1/8" to female 1/8" - attenuator cable - Falcon030.

If I turn my amp up all the way I can BARELY here it... But at Radio shack, I wa told this was the only attenuator cord available... Just says attenuator cable, for hooking Speaker outs to Mic ins...

thanx. Any help is appreciated...

BTW, I swapped RCA-1/8" cables so I know its not that...

Yes, Spectre GCR v3.0 works fine in 16MHz mode on the MSTE. As far as your
second question goes, I find that most things go almost twice as fast,
provided the cache is turned on (16 MHz mode alone does almost nothing).
Spectre is fine with the cache turned on, by the way.

John

The Viking Moniterm 19" monitors for Mega series computers required a board
that plugged into the expansion bus present only on Mega's (this was before
the STe, MegaSTe, TT, Falcon, so I'm not sure about those). Thus, if you have
a MegaST you would need to procure an addition board at the very least.

Incidentally, they sound like old Sun2 or Sun 3/50-60 monitors. There has
been discussion in the past of hooking such monitors to STs, but I don't
remember any positive experiences being related.

I'd have to disagree on that point - the newcomer on the scene, Upoint is probably the easiest to configure, and the easiest to use, being completely GEM based :) It also looks fantastic, and the author is on the net.

Have a look sometime!

To the person inquiring about a port of Linux to the TT/Falcon. (Sorry I haven't got the original post now so I can't quote it).

As I understand it, there are some people working on a port already. They are part of the team which is porting Linux to the 680x0 series of computers including, Amigas, Sun 2s & 3s, Apple Macs, and possibly the NeXT cube (not sure about this last one). If you want more info, ask around in the comp.os.linux.development newsgroup. There is a mailing list but I don't know how any details. Yes there definitely _are_ Atari users involved in the development team. Probably not many though so any help I guess would be appreciated. The point to emphasise is that the project is co-operative with programmers from different platforms doing different things.

Hope this is of some help.

Source record: 194478

Hello,

I am having a problem with getting rid of a folder. I went to delete a folder with a few files in it, and all of the files in the folder itself would not delete. The first thing I checked, was the 'read only' and the 'read/write' options on the 'show information' up on the menu bar during desktop use. When I got there, both of the options were grayed out, and I could not change them. I guess it is saying that it is not readable or writable.

If anyone can help me get rid of this folder, I would be grateful:)

Thanks for anything,

Joseph Hogan

Try using a "ground loop isolator" from Radio Shack, the attenuators never
did anything for my Falcon.

I got the QuickLinkII program with my Maestro FaxModem, and ran it on
PC-Ditto (software version, pretty old), and it was ways too slow to be
of any use as a coms prog, forget the fax.

After getting AT-Speed C16 for other reasons, I discovered that for some
reason AT-Speed does not like the fax part of it, but worked generally as a
coms program, although I had a few problems with it too. Someone suggested
that it is the 9600 baud the AT.. doesn't like, but I discovered with
STraightfax, that my test machine in Dad's office only runs at 2400 baud
anyway, so something is funny about the RS232 support of the AT card.
(I actually was told that QuickLink2 would work, but ...).

So maybe your 386 card is a bit weak on the serial port too.

Anyway, I currently run STraightfax (for the ST), which runs fine if you
don't pair it up with QuickST.

I hope this is of any good to you.

Try using a "ground loop isolator" from Radio Shack, the attenuators never
did anything for my Falcon.

MS>Believing their ads, it renders about 50% more capability.

Don't believe them, because ddd-compress is working on a very simple level. Normally it gives you about 30% or less additional disk space but you can't use it on executables, only on data files. It's more like DataDiet by working on a file base while DATAlight is working as a compressor hooked to the Rwabs() vector therefore compressing _all_ data including FATs and directories.

>asks you and will even stop altogether.
This is only true if you give the correct answers. One mistake means it will
start to ask more often (or just kill you, it depends on the hit/miss ratio
while answering the questions). I also found a text "You've been found guilty
(in your abscence) of stealing a star ship because you gave false answers
to our questions too often" in the binary.

After all, the copy protection was nasty for the first three or four hours
of playing only (while trading between sol and barnards start); I didn't
have any problems since then...

There's one question left: Is the copy protection case sensitive or not?
The current version 1.05 already says that you must include headings while
counting but says nothing about capital/normal letters. Did anyone try it?

>Ah, my panther is invulnerable to you. I have enough sheilds and an energy
>booster that a 4MW beam laser can't get through before it over heats, and they
>recharge before it can fire again. Although if you've got a cooler...
Yes, I do have one, life would be impossible without it. It depends only on
the number of shields you have. A 26 shield ship suffers hull damage after
15 seconds of fire from a 4 MW beam laser. Since this was a computer ship I
do not know wether it was equipped with an energy booster or not.

Just one question about the panther: I know that it has a class 8 drive
built in. What happens if this one is destroyed? Are you able to replace
it or do you have to buy a new ship?

>Then again, my turrets both have 20MW beams, and I'm expert with them...
You are expert with you lasers, the computer is not. And this is the main
problem, a real ship comparision needs equal players; not a player and a
dump computer. I DO WANT a multiplayer frontier right now ;-)

>Add to these:
> - bottom turret doesn't work on Boa freigter - trying to use it causes
>the top turret to fire down through your ship... BOOM!
Are you sure you've switched to the buttom turret before? The game doesn't
switch automatically from top turret to bottom turret. This would be the
worst bug in the game...

While talking about ships, the manual states that a tiger trader has 1 gun
mounting, in the game, it has 3+F...

> - there is a station in the Riedquat system called 'La soeur du den ham'
>the name is too long to fit the BBS display, causes screen corruption.
Grin, ever tried to use the german version of frontier? It's full of bugs
of this kind (german sentences seem to be longer than english). One of
the reasons for me to buy the english versions :-)

> - If you head fast at a space station and hit max star dreamer you can
>fly through the station with only minor damage - helpful sometimes.
This bug is extremly useful while docking/landing because this is the only
possibility to get into the port without crashing

Another bug:
- missiles are only reliable if you select max star dreamer...

- when scooping from a gas giant with a high gravity (greater than your
ships main thruster acceleration) you should be unable to escape from

the planet. This is true if you use manual control (on any star dreamer setting) and autopilot (on any star dreamer mode except max). On max stardreamer, you can escape without any problems...

Ok, now for the questions section:
- Anyone ever seen a ship with a built-in class 4 MILITARY drive? You can find the string in the binary right next to the class 8 drive...

- Anyone found an ESCORT mission on the BBS (found in the binary)? Which rating do I need in order to get these missions? What's your duty on these missions?

- Did anyone try to lay mines into a hyperspace cloud during an assassination mission? Does it work?

check your internal fuel tank (green gauge above the left side of the
scanner display). In 99% of all cases, this syndrome is caused by an
empty tank. If not, you may have damaged boosters. Check the repair
facility before trying to take off..

Singletasking TOS versions have a limited number of memory blocks, so only
a certain amount of Malloc() calls can be done at a time.

This limit can be configured by FOLDRxxx.PRG.

MultiTOS has unlimited Malloc().

>>ok on it. I'm currently using AHDI 5.00

No, they won't, since they are beta versions that should not be publicly available (and are outdated by the currently used version). Ask the site where you got them from to delete them.

Get the current released versions HDX 5.04 and AHDI 6.06 (or 6.061, which boots faster on STs).

>output!?

Your Falcon's bottom label should quote the voltage range it can be
connected to. For NTSC vs. PAL, I don't know the difference (if any)
between NTSC and PAL Falcons.

One thing I know that PAL Falcons have a jumper close to the RF modulator
- perhaps this is a NTSC <-> PAL jumper.

To make things a little clearer:
Can someone with an NTSC Falcon look up the position of this jumper, and
quote the production code of his Falcon board (number Cxxxxxx-00x in the
front left corner of the PCB), please?

>I bought mine from Silica last week, with 4mb RAM and 127mb hard disk. I
>got MULTITOS(but no install program), Xcontrol, AHDI, procalc, callappt,
>two games, and that's it. No Speedo, AFM or SAM. I wasn't pleased.

That's "close to normal".

Why?

Fact #1: Atari includes SpeedoGDOS, MultiTOS hard drive installation disk
and the audio applications _only_ with HD equipped Falcons.

Fact #2: Atari doesn't ship other HDs than 80 MB.

Fact #3: Some dealers order "no HD" falcons from Atari and include their
own.
If your F030 has a 127 MB HD, this is the case.

Fact #4: Some of these dealers add SpeedoGDOS into these packages, some
don't.

You should at least be able to get AFM and SAM for free. Here in Europe,
they have been released to the public.

SpeedoGDOS is another thing - it's copyrighted. If your dealer didn't
promise to include it, you'll have to buy it. Otherwise, twist his arm
'till he gives you one for free :-)

>If I turn my amp up all the way I can BARELY here it... But at Radio
>shack, I wa told this was the only attenuator cord available... Just says
>attenuator cable, for hooking Speaker outs to Mic ins...

I had the same problems originally myself when trying to link the Falcon
to my stereo sysem which is quite old, or at least the amp is. The problem
was that line output levels have varied over the years. Wirthout
attenuators the level was too high,and with them too low.

The only solution was to get a friend of mine to knock together a variable
attenuator for me in a nice little box.

Works fine for me so you may have to go the same route yourself.

DataLite and DataDiet retail for what, $60-$80 US? Over a year ago, I bought two 54M Quantum drives for $80 each, used. These days, the same disks go for $60.

For the price of the "stacker" software, you can buy another 50 megs or so, and not risk a single byte of data. Adding another hard drive is faster, safer, and just as cheap.

Thanks to the fact that Ataris (with the exception of the Falcon) don't use the brain-dead IDE disk scheme, we can stick up to seven disks onto our machines. I've got four, for a total of ~250M. Works like a charm.

I've heard that it looks (and works!) more like OS/2 2.x than Windows 3.1... Yup, nothing like ripping off an OS that your King has claimed is "dead"...

It's really a pity the PC hardware is such a major loss, especially the CPU... (duh, what's a general-purpose register? Intel sure doesn't know...)

I just picked up an HP500, and I'm having a hell of a time with my word processors. The music notation packages work fine with the printer, but I don't know how to get STWriter or WordWriterST to work with the thing.

I can get them to print out, but I don't know how to get Bold, Italics, and other such effects. Do I need separate printer drivers? Anybody know the solution here?

Thanks

I can think of several causes,
a) mouse button is jammed down causing keyboard processor to go into the wrong mode at boot up. Happened to me after I dropped the mouse once too often...

b) joystick autofire is on causing keyboard processor to go into the wrong mode on boot up...

c) Keyboard processor is knackered. Cheap to replace though...

MD> for this? I couldn't find any useful information in any of my books
MD> about this :(
MD> Martijn Dekker
MD> email: mdekker@fwi.uva.nl

The following might help (GFA BASIC):

r%=PEEK(&HFFFA01)
dcd!=NOT BTST(r%,1) ! data carrier detect (valid carrier)
cts!=NOT BTST(r%,2) ! clear-to-send (modem ready to receive)
ri!=NOT BTST(r%,6) ! "Ring!"

Note that the signals are "active low", which is why the test TRUE/FALSE is
inverted with NOT before being used as a variable.
Put all in a procedure or function to hide the PEEK part as a once only thing
to make your source easy to modify.

Probably the directory entry for the folder has been partially trashed, leaving you with undefined attributes and perhaps other corrupt info.
If you have a disk editor and feel particularily brave one day, you might look for the sector which has the directory with the folder name. The byte after the actual name will be the attribute, and would for a normal folder be $20 -- write this value back and it should be deletable, unless there are other irregularities having to do with the FAT tables of course.
Do first check with Checkdisk or some other FAT/structure analyser that you don't have other problems with the partition.

GV>does this board fits on a STE with a square 68000 chip ? since my
GV>4096STe has a square socket.
You need an adaptor as the Spped-Bridge for DOS emulators.

For the operating system, you can take the english version of TOS 3.06, I
believe.

The patches should all be in the language-independant area of the TOS.

Check the patches for it, I cannot check, because I do not have an
english version of TOS 3.06

Ciao, Steffen

Absolutely correct (I obviously agree with your strategy). For those thinking
along these lines, there is a post in misc.forsale.computers where someone
is selling brand new 40mb fast SCSI drives for $50. That newsgroup has
some great deals on both new and used equipment and software. Prospective
shoppers should check it out!

Sounds to me like your filesystem is a bit toasted. I have experienced
a similar phenomena, where I delete a folder (apparently successfully), but
it does not go away. Running Cleanup ST (ICD) or Diamond Edge should fix it
for you. There are PD/Shareware disk fixers as well, but I don't have any
experience with them.

Diamond Edge is really good software, IMHO. I put it in the "must have"
category for hard drive owners.

But MiNT is Now TOS, remember? ;-)

> And am I suspecting rightly that most of those opposing a TT group
> don't have one?

I don't see much point of further dividing our scattered resources. Most of the discussions in c.s.a.st are valid to _all_ users, not just the few lucky owners of a specific model. If one computer deserves a separate newsgroup, then it's the Falcon, since it has some special areas of use like the DSP and D2D recording. However, I don't support the creation of such a group even though I own one myself.

If we should decide to change things, I suggest that groups are linked to what we do with our computers rather then which model we happen to be using. For example:

comp.sys.atari.8bit (thus being the only exception to the general rule)
comp.sys.atari.advocacy
comp.sys.atari.dtp
comp.sys.atari.emulation
comp.sys.atari.games
comp.sys.atari.graphics
comp.sys.atari.hardware

comp.sys.atari,misc
comp.sys.atari.music
comp.sys.atari.programming.asm
comp.sys.atari.programming.basic
comp.sys.atari.programming.c
comp.sys.atari.programming.dsp
comp.sys.atari.programming.misc
comp.sys.atari.telecom

etc.

In fact, now when I put words to it, I'm beginning to like the idea.

1617. More MegaSTE questions

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 00:26:32 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2hv4jo$97h@mailer.fsu.edu>
Source record: 194411

OK, a few more MegaSTE questions (mine is in the mail!!!).

First, thanks to all that have responded to my previous MegaSTE questions, and in advance to responders to this post. I have a lot to catch up on WRT this model of machine, as it has been around for about 3 years or so (I am reminded of the guy that found out about Fatspeed just a few weeks ago, after using a s-l-o-w ST hard disk for a long time). As I find out about MegaSTE quirks and hacks, I intend to record them in a FAQ of sorts. So, if you have any comments about MegaSTE's that you think might be of use to an experienced ST'er but totally bumbling STE'er please feel free to email or post them. Also, any additional comments about the MegaSTE 16mHz capability (recommendations of auto folder programs to control this feature, programs that don't like it, etc.) would be appreciated.

So, here are the questions:

1. Opinions on the AT-Speed 286 emulator for the MegaSTE: Is it robust, is it worth keeping, how much do they cost? Do they come with a math coprocessor standard? How much does one cost (ballpark figure)?

2. Speaking of coprocessors, it is claimed that the machine I bought has one (independent of the one on the 286 emulation board). I presume this would be a 68881. Must an application be compiled to use the coprocessor for any benifit to be obtained? Can it screw any software up by being there? How much does one cost (ballpark figure)?

2. What is the DB-9 jack on the VME bus cover?

3. Mine has TOS 2.06. Is there any better that can be installed without additional boards/weird hacks? Any bugs I should worry about? Any "must have" patch programs?

4. It has a 48mb internal hard drive (which I intend to replace with a bigger unit). Is the Atari host adaptor built into the motherboard? If not, can it easily be replaced with an ICD AdSCSI Micro?

5. What is a Discovery cartridge? As I now own one, I thought it would be good to know :-).

6. Now that I have an STE, I can look at all those excellent demos that would not work on my ST. Unfortunately, I did not have the foresight to write down the names of those I discovered to require STE hardware. What are your favorites (I already know about the Omega demo, as it was about 50% of my motivation to purchase an STE machine)?

7. What are some nifty things I could stick in that VME slot? Graphics boards? Ethernet (highly desired)? Is it equivalent to the internal

bus connector present in MegaST's, or is it totally different? If different,
does the MegaSTE have an internal bus connector as well?

1622. Atari ST Emulator for Amiga ;-)

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 01:19:49 UTC
From: titan@sys6626.bison.mb.ca
Message-ID: <qVumgc1w165w@sys6626.bison.mb.ca>
Source record: 194426

Okay, why would an Amiga user want an ST emulator? Novelty, I guess. (I collect emulators) So, are there any ST emulators for the Amiga? A few years ago I came across one 200K+ executable file called ATARI1. It worked well on my Amiga 500/2 drives, and I was able to run full colour programs with no noticable slowdown. However, the executable most likely had a copy of TOS in it, so I doubt it was very err.. legal. Or have things changed now since Atari has stopped making the ST? Does anybody have a version of any ST emulator which doesen't require two disk drives? (like ATARI1 did for some odd reason)

Please, no flames. I don't mind the ST, and I definetely like it better than any clone system (the architecture). :-)

There might not be a problem.....if this happens when you boot the computer up, press the space bar once. That will probably fix it.

if not:

Easy fix! don't worry about it, the computer is fine....just unplug your joystick (the fire button is stuck), if there still is a problem, you right mouse button is stuck down, try unplugging that too if you think that is the case.

1624. Falcon 486 emulation & 040 status?

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 01:49:06 UTC
From: selick@acs.bu.edu
Message-ID: <2hv9ei$79h@news.bu.edu>
Source record: 194418

What is the status of the Falcon these days? Is there an 040 option in the works? Is there a 486 emulator (onboard 486 processor) available or in the works? Is there a tower case with external keyboard available or in the works? Any word on the software based modem?

I will be graduating in May, and will probably be asked what computer system I would like to get as a present, and I would like to stick with the Atari since I have Notator Logic, but if Atari doesn't get its act together soon, I may be forced to get a 486 machine. That would really be tragic.

Thanks,
Steve
selick@acs.bu.edu

>DOS machine. Anyone know how I can do it?

Well heaps of people have mentioned how the ST is compatable with
the IBM-PC disc format, just thought i'd mention you could also
just connect the 2 serial ports together with a correctly wired
cable and Zmodem transfer the files. If his discs are formatted
with an older ST, formatted with a few extra tracks/sectors,
or his files are on a HD, then this option would probably be quicker
as you'll eliminate the time and hassel of formatting discs.

Try looking in your modems manual.
If you've got response words turned on, the modem will send the
word "RING" to the computer for every ring.

Probably not the best solution, but certainly the cheapest.... there's
a couple of programs available from the FTP sites that let you
network 2 ST's via the midi ports. They run in the background, but
there's the risk of damaging files if you crash while writing files
using this system!
I think one is called midinet or something like that.

>you need _in_ Falcon030.
>
>btw, in the meantime, the 3,5" externals are cheaper again. Since there's
>almost no supply of 2,5" IDE drives, prices went back up.

Lucky you - down here a 240mb 2.5" IDE = $950 AUS = DM970 = $620 US

whereas an external SCSI II MAC 240mb HD with cable, even soft for the mac is
way cheaper = $600 AUS = DM600 = $390 US

or about that - so here I am thinking of buying a SCSI II external - it's
faster anyway ...

> couldn't be more specific, and the manual makes no mention of problems at
> all (except that the boot partition must be within the operating system's
> normal limit, i.e. 16Mb for ST, 32 for STE).

Some programs were written to assume a 32mb maximum size (in fact, some only allow for 16mb from <= TOS 1.2). To get a partition bigger than 32mb, you will have to increase the disk block size. The "normal" size is 512 bytes per block. Anything higher would be labeled a BGM partition. Some programs don't like this (most notably Cheetah, which will severely fry a BGM partition). The 32mb max non-BGM partition size applies to any TOS version >= 1.4 (ST verses STE has nothing to do with it).

Just about anything that was written or updated in the last 3 years or so should be able to handle BGM partitions just fine. Only old low level hard disk utilities are suspect, as most applications did not need to be updated specifically for BGM partitions. If you have any old ones around, I would be very cautious about using them on a BGM partition. Better is to purchase a new one like Diamond Edge.

Also, if you are using an ICD host adaptor, you should be sure that your ICD software is not really old. ICD will update the software for about $15, and I am hoping that soon it will be available via ftp. If you have version 5.x or 6.x, you are probably OK.

Now, with all that said, I personally don't use very many BGM partitions. Increasing the block size to greater than 512 bytes will result in more wasted space, as the block size is the smallest allocation unit on a hard disk. So far, I have not needed more than 32mb in a hunk for anything. I have one BGM partition for MOD files, as they tend to be quite large (thus minimizing lost space due to larger block size). Also, every since I, er, verified Cheetah's destructive tendancies on BGM partitions I have been a bit leery of them. YMMV.

1634. MultiTOS Gemini 1.99 console interaction problem

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 07:50:15 UTC
From: tvoverbe@estwk5.estec.esa.nl
Message-ID: <CK4J3s.46K@wm.estec.esa.nl>
Source record: 194427
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

When trying out Gemini 1.99 together with MultiTOS 1.0 (Mint 1.04 + AES 4.0)
on my TT I noticed the following problem.
When running a TOS/TTP program in the console window both Gemini and the TOS/TTP
program are competing for keyboard input. Very annoying when running something
like more and you have to hit the space bar a number of times till the next
page appears. After exiting more you then get all the 'missed' spaces echoed.
I suppose this is a generic problem when running any TOS/TTP program in
Gemini's console window.
Has anybody else noticed this ? Any explanation and/or fixes or workarounds
known ? Does any of our German friends have some more info from the
Gemini MAUS group ?

Ton van Overbeek, tvoverbe@wk.estec.esa.nl

To tell the truth, only ATARI emulators with ROM sockets for original
TOS ROMs are legal, due to the fact that the ATARI OS is (c) ATARI corp.
(surprise) and one can only get it in ROMs.

One commercial ATARI emulator is available in Germany, it's called Amtari
and the price is somewhere around 200 US$.

And btw, ATARI corp. may not longer produce the ST, but they still DO
produce TOS based computers.

Is this a bug? After all, the ship does tell you that the internal fuel tank's empty when you change engines, and I don't think the auto-refueller (a waste of space IMHO) works when docked on either type of engine.

>>timer locks at normal speed (regardless of icon position). Sorry to moan but

The last one is the right one. If it fails, then usually because of
different line endings (CRLF vs. LF). Try to make them consistent
(either by removing CR's from both the sources and the patch, or by
adding them).

Using -DMULTITOS has a couple of other minor tasks, but does not make large differences to the kernel. I built a non-Multi kernel for use in my programming set-up, then rebuilt with the Multi flags for a 1.09 MultiTOS kernel. This did not work at first, but was a configuration problem: I did not have a mint.cnf file, and 1.04 did not mind that. For 1.09, I had to create such a file, otherwise it could not find the multi version of GEM.

I downloaded the recommended versions of patch, and couldn't get them
to work; they had problems trying to create filenames of greater than 8.3
in my tmp directory. This *might* have been solved, perhaps, by a correct
setup of UNIXMODE or whatever, but in the end I just printed off the files
and did the patch manually.

The Sozobon compiler can be built to be a cross compiler under unix. It certainly compiles under unix if you set the right flags, but I don't know how well the code runs. Also the stdio library has a serious memory leak.

|> thanks.. and any recommendations for a good book on GEM/TOS
|> programming would be helpful, too. I have the atari compendium btw.

The Compute series by Sheldon are quite useful if you can get them. Also the "Pro GEM Programming" series of articles ftpable from atari archive are good. The DataBecker GEM book should definitely be avoided.

Hi !

I'm looking for a postscript driver for gdos, preferable one, which
can also write to a file.

Any ideas ?

A few questions...

The box boasts 80-odd missions - surely these aren't the bbs tasks
that you can get from the military - these seem to be pretty standard
fare to me (ie: they're standard sentence with varying parameters)

Is the protection case-sensitive ?

And a few observations...

I don't object to the protection - I think it's quite a good idea
actually - the more you play the more it trusts you. What I found
pretty bloody annoying was that you need a monitor to get it right
reliably. Playing on a TV and trying to sort the difference between
a 3 and an 8 is impossible. A larger font for these would have been
nicer.

I don't think you ought to be able to select targets for homing in on
when the game is paused ... Makes fighting too easy.

If a game like this comes out for the Jag, I'll buy the Jag to get it.
Can you imagine what the Jag's real-time texture mapping etc. would
do to Frontier ??? Wow!

Simon.

Message-ID: <1994Jan24.120317.28314@unix.brighton.ac.uk>
Source record: 194321

To apply thediffs for MiNT 1.09 to MiNT 1.08 I think you do

patch -l < <name of diff file>

The -l applies the patch loosely(?) and should work right then, without -l
it looks for the exact pattern over which to apply each line of the diff and
because of cr/lf or spaces, etc it fails to do this. Hope this works better
for you.

Also, apply the diffs to an untouched copy of the 1.08 source.

The things about getting stuck in the station as you try to leave can be solved by going back in (ie. request landing again and then autopilot), and buying some fuel and refuelling. If you have some fuel you don't have to go back I don't think.

I have only tried this once as it has only happened once recently.

At the time I had an auto refueller, but I had to manually refuel.

Hi!
Sorry, but when I want to login on the school mainframes, I just use Rufus v1.04, I know there is v1.35 but that one doesn't work properly when using Rufus as accesoiry, which I usseaully do. When I login I set the terminal at vt100, and the schoolterminal also, and Rufus doesn't know better than it is just another BBS. If I want to transfer file's I use Kermit.

I have an Atari 520ST+ and a Tornado 9696 fax/modem, Rufus v1.04. The school has a UNIX system.

Use the radar mapper to find out.

>Just one question about the panther: I know that it has a class 8 drive
>built in. What happens if this one is destroyed? Are you able to replace
>it or do you have to buy a new ship?

You can replace/repair it if you find somewhere that sell class 8's. Or you can replace it with a class 7, but you get much less range. I decided it wasn't worth risking getting it damaged and fitted 100 shield generators and an energy booster.

>>Then again, my turrets both have 20MW beams, and I'm expert with them...
> You are expert with you lasers, the computer is not. And this is the main
> problem, a real ship comparision needs equal players; not a player and a
> dump computer. I DO WANT a multiplayer frontier right now ;-)

Yes, that would be brilliant. The only time my panther has been destroyed was when I collided with a large planet whilst dogfighting someone I was supposed to assassinate. (Imperial courier - 30g + 20MW laser... could have done me some damage...)

>> - bottom turret doesn't work on Boa freigter - trying to use it causes
>>the top turret to fire down through your ship... BOOM!
> Are you sure you've switched to the buttom turret before? The game doesn't
> switch automatically from top turret to bottom turret. This would be the
> worst bug in the game...

The game does automatically switch from top to bottom turret (with my panther anyway) and there is no way to do it manually.

> While talking about ships, the manual states that a tiger trader has 1 gun
> mounting, in the game, it has 3+F...

It also states that an imperial trader requires 6 crew, in the game it needs one. There are also discrepancies in the main thrust stats.

> Grin, ever tried to use the german version of frontier? It's full of bugs

No, I have the English version.

>> - If you head fast at a space station and hit max star dreamer you can
>>fly through the station with only minor damage - helpful sometimes.
>This bug is extremly useful while docking/landing because this is the only
>possibility to get into the port without crashing

It was useful when I realised the auto-pilot had misaligned (I went to get
a drink while it docked) and I had about 10% hull and falling. hitting max
star-dreamer put me completely through the station without docking and no
further damage.

> Another bug:
> - missiles are only reliable if you select max star dreamer...

I have no problems blowing things away with naval missiles. Although I
rarely use missiles because it's easier to leave the autopilot set on
where you are going and blow em away with the turrets.

> - Anyone found an ESCORT mission on the BBS (found in the binary)? Which
> rating do I need in order to get these missions? What's your duty on thes

Nope, I've only had deliveries so far. (Competent + sir)

> Does anyone know of a good grammar checker for the ST?
> PD would be preferred, but any info would be appreciated.

Calligrapher Gold III has a grammar checking pack. It works in a very similar way to a spell checker. It scans through a document highlighting anything it doesn't like. You then if you like have the change to alter or correct the highlighted text. There are four or five main grammar checking sections of the pack :
error - Speaks for itself
reduction - reduce wordy parts
formal - suggests formal alternatives
ise and ize - checks the ending of different words

Like a word processor you can add or ammend the rules which Calligrapher uses to check the text.

Also as part of the pack there is a word length frequency bar chart which is useful for seeing which lengths of words are most frequently used. Another window gives a list of all the words used in the document and the number of times used (see below).

the 2 a 14
in 6 Atari 56

If you need a grammar checker than I would recommend Calligrapher although it is hardly PD at about 109.00 pounds.

Greetings, I hope someone can help me with this:

I have an Atari 520STFM, quite a late one with surface mount MMU chip
etc, and Frontier/Marpet XtraRam Deluxe with 2 mbyte installed.

This machine has been working perfectly for 3 years know, I had
the PSU replaced under warranty (wish I hadn't, but thats another
story) and use the MIDI ports extensively, and the serial port
occasionally. I have been running with a TV as the monitor.

I decided to take the plunge and go hi-res. I purchased a SVGA
Mono monitor with Atari adaptor from Ladbroke computing. I could
not get this monitor to work with my ST. The speaker on the ST adaptor
emitted a constant frequency (and quite loud, not just pickup) tone
when enabled. The monitor did not synch properly, nothing resembling a
desktop appeared. I tried booting in several different ways including without
a disk present. The system booted but no desktop (I know it booted cause
it stopped accessing the drive). I tried plugging the TV in while booting
with the monitor connected and there WAS a desktop on the TV screen but it
wouldn't synch and it was all screwed up (menus/icons in wrong place,
only a small portion of the screen visible).

I suspected a problem with ST adaptor. Ie line-out connected to
a synch line. Ladbroke suggested
trying the monitor with another ST. I did this. My friends "vanilla"
520STFM produced EXACTLY the same symptoms.

I shipped the monitor back to Ladbroke as doa. Today they have finally
got round to testing it and claim it works PERFECTLY on a 1040 STF they
have. Also, they claim there is no constant tone from the ST adaptor. We
quickly discounted the theory that the adaptor was damaged in transit and
miraculously cured by the journey back to Ladbroke. Their engineer suggested
some tolerance problem.

I am going to try my ST with a friends SM124 tonite. I THINK I did this a few years ago and it worked. Its possible the Mono output has become broken in the meantime I guess. But then my friends STFM gave the same symptoms.

So, I have the following questions for all you Atari experts out there on Usenet.

(1) Has anyone else experienced problems connecting a hi-res monitor to an 520STFM, or any other Atari? I believe mine to be quite a late model, surface mount MMU, soldered in shifter etc. It was part of a Discovery pack (ie sold
as a games machine).

(2) Has anyone ever experienced the sort of symtoms I describe with a any hi res monitor? If so how did you fix it.

I'd appreciate replies by e-mail as I have to decide what to do asap. Ladbroke have been quite reasonable and offered to either have a look at my ST or let me have an SM124 that they use for testing instead. I'd prefer to have a more future-proof SVGA than a used SM124, and I'm also reluctant to let others inside my machine and to loose it for several days/weeks.

Thanks a lot in advance for any information.

(and I wish I'd just brought it into the lab and got the guys here to help me sort it out, but it was a NEW monitor. As a colleague said, "did they get it right first time?".

Message-ID: <1994Jan24.134841.15333@gdunix.gd.chalmers.se>
Source record: 194358

Well, hello world!

Have you tried out the fantastic tracker OCTALYSER? It's a tracker for
all Atari STE/Falcon (8bit tracker). It can handle 4, 6 or 8 channels,
and on a ordinary STE it can preform:
4 channels true 50 kHz replay
8 channels multiplex 50 kHz replay!

It handles ALL Amiga ProTracker-commands!

Well, I'm one of the coders of the Octalyser STE, and if you have
any problem with it, please let me know!

The Octalyser is shareware, and the registred users will recive
a newer version (0.94).

I have Lattice C 5.5 and have found it tough going. I know GFA Basic reasonably well and thought it would be quite easy to port some of my programs. How wrong could I be!

As noted above ring binders would be much better (GFA Basic style).

Also how about a GFA editor. i.e. automatic indenting, syntax checking, folded down procedures and functions, etc. Has anyone noticed that clicking to the right of a line leaves the cursor dangling in mid air? A good editor would take the cursor back to one character to the right of the end of the current line.

1664. Linux for Atari TT/Falcon (680x0 x >= 3)

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 15:05:11 UTC
From: robert@and.nl
Message-ID: <CK538o.38p@and.nl>
Source record: 194359

Hi,

Now it's time to make an end to all speculations on the status of Linux
on the Atari TT/Falcon platform.

I am one of the developers of the low-level device drivers for the
Atari.
There are three other people working on the project.
One coordinator who should be making the interrupt handling code.
One person does the console driver (screen output)
One person does the SCSI driver.
I do the keyboard/mouse/joystick driver, and I was just starting work
on the serial port driver.

The status is relatively to the Amiga several months behind.
My personal main problem is that I did not have a decent development
environment. My falcon is a prototype and is not too fast. I can't
get the minix fs extension for MiNT to work, so files with long names
get clobbered.
In the meantime I bought a second hand 386-PC, put in a big harddisk,
and I am now working on installing a cross-compiler. When all this
works, I can continue my work.

I haven't heard from my fellow developers for a long time. I think
the coordinator is no longer on the net. Perhaps it's time for me
to volunteer to be the next one. The only problem is that my
system is not really on the internet. We only have a uucp-connection.

So if someone is interested in putting some effort in writing the real
low-down bare-metal stuff, mail to me and I will give you all information
you want.

In the meantime you can plug in on the linux-activists mailing list.
There is a special interest group (channel) called 680x0.

Hi there,

I need some help from you net-gfa-programmer-guru:

I need to run a TOS (ttp) prohram from GFA-Basic and redirect the output of
the program in a certain area of the screen , such as a window of the program
from where I launched the ttp.

Is it possible ? and How ?

Since I have the source of the ttp program can I compile the gfa-prog and the
C module and call the module as a procedure from the gfa prog ?

Thanks in advance!!

Savino

In article <1994Jan24.125525.8938@mnemosyne.cs.du.edu>, hruegg@nyx.cs.du.edu (Hans Ruegg) writes:

|> Also, what is the 'stdio memory leak'? Lets fix it!

As far as I can remember, it goes like this:

fopen() checks to see if there is already a buffer for the file handle it is about to allocate and if not malloc()'s one.
fclose() does not free() the buffer but does set the buffer pointer to zero, losing track of the memory and causing fopen() to malloc() a new buffer next time around.
Thus if you open and close enough files you eventually run out of memory.

This bug existed at least up to the point where HSC spun off from Sozobon C because it bit me under HSC 1.40 as well as an old version of Sozobon (my sequencer grabs all but 8K of RAM for itself so the memory leak kills it relatively quickly if not painlessly :-(). It's easy to fix though - I just commented out the offending line from fclose() & recompiled.

BTW where is Ian Lepore these days? - I've not seen him post for months.
And whatever happened to HSC 2.0 ?

> hard disk.

Nope, the smallest allocation unit is a cluster (maybe you were thinking
of Unix instead of Gemdos?). The advantage of increasing the clustersize
is better speed, the disadvantage (like you said) wasting space.

The three Gemdos filesystems I have use one logical sector per cluster,
but on most systems clusters consist of two or four logical sectors.

> So far, I have not needed more than 32mb in a hunk for anything.

Partitions <= 32MB can still be BGM. My boot partition is just under 32MB
with 4KB logical sectors and one sector per cluster.

The article says to anonymous ftp to ftp.cdrom.com, get the file
/pub/cdrom/cdroms/atari/index.txt.

/Most/ of the CD is a copy of atari.archive, the files even have the
same comments as the a.a index file...

Bollocks. If a diskless 68030 16MHz UNIX workstation (HP9000/330) can
run X without problems (I have worked on those for years) then a Falcon
should be quicker at it, because it doesn't need to send everything
over an Ethernet connection.

}> be a real bargain for a 19" monitor.
}
}The Viking Moniterm 19" monitors for Mega series computers required a board
}that plugged into the expansion bus present only on Mega's (this was before
}the STe, MegaSTe, TT, Falcon, so I'm not sure about those). Thus, if you have
}a MegaST you would need to procure an addition board at the very least.
}
}Incidentally, they sound like old Sun2 or Sun 3/50-60 monitors. There has
}been discussion in the past of hooking such monitors to STs, but I don't
}remember any positive experiences being related.
}

OK, I know it's a TT, not an ST, but...

a few months ago, we modified a Sigma Designs L-View 19" monitor to work
with my TT. It wasn't much more than making a cable to go from the 15 pin
VGA jack to the 9 pin monitor jack. Also had to make a little circuit to
invert either the horizontal or vertical sync (can't remember). And then
adjusting the horizontal sync inside the machine to match the TT.

It works great and it was free to boot. Barely use the other monitor these
days, I don't think it's been plugged in since maybe November..

1672. Re: Any RIP Readers for the ST?

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 17:19:14 UTC
From: Merz@mm.sh.sub.org
Message-ID: <Up-EAYOFFVI@mm.sh.sub.org>
Source record: 194240

In <esoreCK3HGs.I95@netcom.com> Steve Rosenberg wrote :

> Are there any free/share/commercial programs out there for the ST
>which allows one to view .RIP graphics from a PC board? Even an off-line
>reader would be terrific, as I have access to lots of RIPs and would like
>a quick look.
>

Hi Steve,

as far as I know there is only one ST-RIP-Terminal available.

I quote from the english documentation (YES!):

>>> STrip <<<

Copyright (c) 1993 by Lars Kupferschlï¿½ger

The first terminal program for the
Atari ST series of computers that
supports the Remote-Imaging-Protocol (RIP)
...
1 What's STrip?

STrip is the first terminal program for the Atari ST which
supports the Remote-Imaging-Protocol (RIP).

RIP has been developed by TeleGraphics, a USA Company and is a
7-bit ASCII transfer protocol for color graphics, mouse control
and more.

RIP requires a graphics resolution of 640 * 350 pixels in 16
colors, which is provided by an IBM compatible PC with EGA
compatible graphics card.

The monochrome mode of the Atari ST offers an appropriate
resolution(640 * 400 pixels min.) but only two colors, namely
black and white.

This means that a 100% implementation of RIP isn't possible on
the ST because the necessary hardware requirements are not
available.

From the software developer's point of view, this lack is the
special challenge of implementing RIP on the ST: To represent
RIP codes as good as possible on a black-and-white plane.

Those who have dealt with this problems a little bit closer will
have recognized that this isn't an easy task and should not be

underestimated.

With "STrip" I have developed an application which achieves very good results on this matter. But because of the technical reasons cited above it can't come up to the standard of a real color implementation.

To date, this version of STrip v0.95 supports appr. 90% of all RIP functions.

Of course, STrip will be expanded further and adapted to the developing standard.
...
2 Hardware requirements

STrip has been designed for the monochrome resolution of the Atari ST (640*400 pixels).

A higher monochrome resolution could not be tested but should be possible.

Color graphics cards or the two color modes of the Atari ST are currently not supported.
...
6 Contact address

1673. HELP: Questions about ADHI...

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 17:36:16 UTC
From: vij@vnet.ibm.com
Message-ID: <2i10ug$fer@tornews.torolab.ibm.com>
Source record: 194239
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi All,

I've got some questions regarding the usage of
Atari's hard disk drivers and their features...

Some background: I've got a Mega STE with TOS 2.06
and am currently using ADHI 5.00 and HDX 5.00
I've recently downloaded HDX 503C, HDX 504,
ADHI 605C, AHDI 606, and ADHI 6061.

I'd REALLY appreciate ANY answers to the following
questions. I know that there are others out there
with similar questions too...

1) What is the "best" ADHI and HDX to be using?
Are there any versions to stay away from?

2) I assume it's ok to use the latest HDX with
my MSTE, but how about AHDI? In one of the
readme files, they mention the Falcon but not
the MSTE. Is AHDI 6061 Mega STE friendly???

3) What are the differences between AHDI 606
and 6061??? (ie: was something in 606 broken).
There was no readme with AHDI 6061.

4) Assuming I'll move up to ADHI 6061 (or whatever),
how do I do it? Do I just use HINSTALL to
de-install the current driver and install the
new one? Do I need to reformat or anything,
or is it as easy as copying SHDRIVER.SYS to
by boot partition?

5) What's the relationship between SHDRIVER.RAW,
SHDRIVER.SYS, and AHDI.PRG? For a given version,
all three files are the same size. Are they
just renamed versions? It's my impression that
HINSTALL uses SHDRIVER.RAW to create a SHDRIVER.SYS.
I'm not sure what ADHI.PRG is used for...
The reason I ask is that AHDI 6061 just comes with
ADHI.PRG (ie: know SHDRIVER.RAW).

Thanks in advance to anyone who can help. I'm kinda
living on the edge 'cause I haven't backed up my
hard drive yet (I know, I know) and I don't want to
trash my drive when upgrading...

VIJ...

> without additional boards/weird hacks? Any bugs I should worry about?
> Any "must have" patch programs?

TOS 2.06 is the best and latest official ROM for your computer, but there exists a nice program called WINX that offers movable windows in the background (like MultiTOS) and a number of other useful bugfixes and improvements over standard TOS. You can even make a new EPROM out of it thus saving some RAM space.

NVDI is yet another of those "must haves". It will speed up most GEM operations tremendously and offers a built in GDOS.

1675. Mega STe Coprocessor and Spectre

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 17:58:57 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CK5BA9.MCn@watserv2.uwaterloo.ca>
Source record: 194365
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a Mega STe without a coprocessor and I have a Spectre 3.0:

1. Will both the 68881 or 68882 work (are they pin compatible?)
2. What package type is the Mega STe socketed for?
3. The Spectre manual says it will recognize the coprocessor in
a TT but doesn't mention the Mega STe (it probably wasn't out
when the 3.0 Spectre was released). Has anyone with a Mega
STe and coprocessor confirmed it works?

How much should I pay for a coprocessor? Every place I called in
Toronto does not have 68881 anymore - they say they're being phased
out. A 68882 costs $122. Is this reasonable?

Thanks,

Newsgroups: comp.sys.atari.st
Subject: Speedo w/SLM804 and MSTE
Summary: won't work?
Keywords: Speedo, SLM804
Organization: Faculty of Engineering, Memorial University of Newfoundland

I have Speedo, but can't get anything to print on my SLM804. If you
bring up the devices (or printers?) acc, is says printer for the
port to use. It should be DMA, but this option is not selectable.
This can't be an oversight by Atari, can it?

Any body have any ideas? I have tried to print with both Works, and
STraightFAX 2.0, both Speedo prgs. neither will print.

I have never been able to get LaTeX to print with the SLM804 either...
I'm going to have another try at that soon, though...

thanks

Well, you could always steal it since many others seem to think that that's perfectly OK with discontinued software. <bad joke, I admit>

But GST no longer exists? Are you sure?

At any rate, you could always post a 'WANTED TO BUY' notice as I'm sure someone out there has a copy they would be willing to sell you.

1681. ST Hi Res Monitor /520STFM compatibility problems.

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 18:57:15 UTC
From: tjl@siva.bris.ac.uk
Message-ID: <CK5DzF.88@info.bris.ac.uk>
Source record: 194368
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Greetings, I hope someone can help me with this:

I have an Atari 520STFM, quite a late one with surface mount MMU chip etc, and Frontier/Marpet XtraRam Deluxe with 2 mbyte installed.

This machine has been working perfectly for 3 years know, I had the PSU replaced under warranty (wish I hadn't, but thats another story) and use the MIDI ports extensively, and the serial port occasionally. I have been running with a TV as the monitor.

I decided to take the plunge and go hi-res. I purchased a SVGA Mono monitor with Atari adaptor from Ladbroke computing. I could not get this monitor to work with my ST. The speaker on the ST adaptor emitted a constant frequency (and quite loud, not just pickup) tone when enabled. The monitor did not synch properly, nothing resembling a desktop appeared. I tried booting in several different ways including without a disk present. The system booted but no desktop (I know it booted cause it stopped accessing the drive). I tried plugging the TV in while booting with the monitor connected and there WAS a desktop on the TV screen but it wouldn't synch and it was all screwed up (menus/icons in wrong place, only a small portion of the screen visible).

I suspected a problem with ST adaptor. Ie line-out connected to a synch line. Ladbroke suggested
trying the monitor with another ST. I did this. My friends "vanilla" 520STFM produced EXACTLY the same symptoms.

I shipped the monitor back to Ladbroke as doa. Today they have finally got round to testing it and claim it works PERFECTLY on a 1040 STF they have. Also, they claim there is no constant tone from the ST adaptor. We quickly discounted the theory that the adaptor was damaged in transit and miraculously cured by the journey back to Ladbroke. Their engineer suggested some tolerance problem.

I am going to try my ST with a friends SM124 tonite. I THINK I did this a few years ago and it worked. Its possible the Mono output has become broken in the meantime I guess. But then my friends STFM gave the same symptoms.

So, I have the following questions for all you Atari experts out there on Usenet.

(1) Has anyone else experienced problems connecting a hi-res monitor to an 520STFM, or any other Atari? I believe mine to be quite a late model, surface mount MMU, soldered in shifter etc. It was part of a Discovery pack (ie sold

as a games machine).

(2) Has anyone ever experienced the sort of symtoms I describe with a
any hi res monitor? If so how did you fix it.

I'd appreciate replies by e-mail as I have to decide what to do asap.
Ladbroke have been quite reasonable and offered to either have a look
at my ST or let me have an SM124 that they use for testing instead.
I'd prefer to have a more future-proof SVGA than a used SM124, and I'm
also reluctant to let others inside my machine and to loose it for several
days/weeks.

Thanks a lot in advance for any information.

(and I wish I'd just brought it into the lab and got the guys here
to help me sort it out, but it was a NEW monitor. As a colleague said,
"did they get it right first time?".

I have just got the spectrum (8-bit computer) emulator and i am wondering has anyone got any old spectrum games uploaded to work with it.

As i have got rid of my spectrum years ago i cant get any software fot the emulator.

If someone has got games for it can you get in touch.

cheers
Philip

From the Holy Book of <CK50pw.Mr5@ryn.mro4.dec.com>
as spake by nagel_e@cecehv.enet.dec.com (Besiktas...) :

>In article <1994Jan24.125525.8938@mnemosyne.cs.du.edu>, hruegg@nyx.cs.du.edu (Hans Ruegg) writes...

>>Also, what is the 'stdio memory leak'? Lets fix it!

>Ah, but I bet there is no memory leak if you use the mintlibs is there?

Not as far as I know [knock on wood ;)]. A 'stdio memory leak' does sound like a bug in dLibs rather than the compiler proper. I know of a few bugs in dLibs, but I hadn't heard of this one.

On the cross-compiling issue: I'm not sure how different HSC 1.40 is from Sozobon 2.0 (which I presume is what you're using), but it's quite possible that you can use the MiNTlibs as a drop-in replacement for dLibs. If not, you should be able to build it from the sources without problem.

>> Johann Ruegg
>> Sozobon Ltd.

>What? There is a company with the name sozobon?

Sozobon Ltd. is, I believe, the name of the group that made the Sozobon compiler in the first place.

I've just sifted through the hundreds(!) of letters in this newsgroup.
Most of them were so Tech that I just skipped them, so I know that
I'll get a slagging for this but...

Does anyone out there use STOS?

Yes, yes I know its not a proper language and that real programmers do
it in C/C+/C++/GFA/ADA etc etc but I'm looking for a contact to exchange
ideas with.

Please e-mail me directly (gstewart@cs.strath.ac.uk) and I'll write back
first Practical Session I get. No FAQs. No Flames.

From: Steffen_Engel@pe2.maus.de
Message-ID: <A5959@PE2.maus.de>
Source record: 194337

MS>The best solution is to get the patches for a TOS 3.06 - the patch
MS>file is available for free, but it is not allowed to upload it to any
MS>server other than the german 'Maus PE' BBS.
Since the Patches are released from the c't, they may be uploaded to
other BBS's.

The version not to be uploaded somewhere else, was a last beta and for
saving the right of publishing in the c't.

So the next versions will be free for anywhere.

By the words: there are some minor changes to the Patches (IDE-Boot, a
little Bug, Mega STE adjustments) coming the next days.

MS>but it should be possible to change it for a different language TOS -
MS>it would require some assembly knowledge.
I believe ther are no changes to be made, because the TOS should be the
same, except for the different resources at the end of the TOS.

I'm sorry, I can't check for it, because I do not have an english version
of TOS 3.06.

MS>If you are interested, send me a mail, I will then send you a copy via
MS>mail (I think that's allowed).
Not this Version from MAUS PE, please, because it's an undocumented
version. The version from c't is full documented and with the assembly-
sources.

Bye, Steffen

1692. GEMAR 2.x in the US?

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 22:12:38 UTC
From: saj@chinet.chinet.com
Message-ID: <CK5n13.Jo2@chinet.chinet.com>
Source record: 194383

This may be several layers deep in misunderstandings. I want to try out GEMAR 2.x on my Falcon. I fetched the most recent version that I could find using archie (1.2, I believe, from uni-kl). I then emailed Steffen Engel and asked how I could get a current version (I may not have been entirely clear. I'm offering to pay money for disks and registration). He answered that he didn't know.

So here I am with a Falcon030 and a BMS tape backup unit. The Beckemeyer driver for the tape is 68000-specific. I'd like to be able to use the tape again, and tar format would be nice. Any suggestions, using short words and short sentences for a person who gets confused himself as easily as he confuses others?

>But GST no longer exists? Are you sure?

GST still exists. A update to Timeworks Publisher (TWP II) was released
last year. One of the mail order places should have it, or as Hutch says
go for a used one. I see them for sale every so often

```

The Sozobon compiler can be used even on an st with a single floppy and 1MB RAM (although this will be slow and floppy switching is a pain.) You'll need a comman line shell. For such a small system i'd recommend gulam because it has all the necessary functionality builtin and is fast.

LittleNet, which uses MIDI cables, comes highly recommended by some. (I have it but have not set it up for use yet.) It sets up the other computer like a disk drive for file transfers, running programs, etc. I believe it is freeware.

1696. The Future of Atari

Newsgroup: comp.sys.atari.st
Date: 1994-01-24 22:52:59 UTC
From: alberto@terapin.com
Message-ID: <alberto.2cun@terapin.com>
Source record: 194400

Hi everyone. Well I've been keeping up with ATARI for a number of years. I now own an ATARI 1040 STE, although I started out with an old ATARI 8-bit. I have been considering selling this system but don't think I would get what its really worth since it hasn't been used much and is in excellent condition.

I've been thinking about upgrading it, ram/speed/graphics. It seems as though ATARI is more than ready to faze it out though.. I was at one point thinking of getting a Falcon030. I decided against it, because as it looks now, the bird is dead.(No flames please!).

I consider the TT/030 a superior machine to the Falcon030. I think the Falcon is just a slow TT with a "fancy" graphics board. I am considering getting a TT. I'm mainly into programming, and want to develop ATARI software. I think the best machine would be the TT. It has good speed/graphics boards upgradibility, the power needed. Although I'd like to make programs only for the TT and its graphics card, making these programs compete with the ones on say MAC and IBM platforms. I'm not sure yet, but am considering my options.

What do you guys think about this? Just would like to hear opinions, suggestions.

Thanks,

alberto@terapin.com

From: wilsont@rahul.net
Message-ID: <CK5q7D.ELI@rahul.net>
Source record: 194387

Could someone explain the control method in frontier? some one
mentioned "like star glider II" earlier, but while it was a good idea
to have throttle and guns on the mouse, I found some problems with
SG2. One, the shots never went to the cursor, only straight ahead.
Also, every thing was on a plane, much like epic. if you pointed 'down'
it acted like an airplane, not a true space craft. At least in the
first elite and wing commander the ships can go in all directions
easily. (on all axies even)

I didn't really like Elite I, because it was nothing but trading,
and every other time i'd warp, those alien motherships would kill me.
There didn't seem to be an immediate goal either. Docking killed me
the other half of the time, it was just too lame...why would the docking
bay rotate?!?

does Frontier have a goal? a plot?

Please tell me all about this game, thanks.

GST still exists. A update to Timeworks Publisher (TWP II) was released last year. One of the mail order places should have it, or as Hutch says go for a used one. I see them for sale every so often

LittleNet, which uses MIDI cables, comes highly recommended by some. (I
have it but have not set it up for use yet.) It sets up the other computer
like a disk drive for file transfers, running programs, etc. I believe it
is freeware.

Re Mega STE questions:

>2. Speaking of coprocessors, it is claimed that the machine I bought has
>one (independent of the one on the 286 emulation board). I presume this
>would be a 68881.

Most probably. Most weren't shipped with a co-processor fitted, so if yours
has one, its a bonus.

>Must an application be compiled to use the coprocessor

Yes

>How much does one cost (ballpark figure)?

About 70Ukp (probably 70$ as well ;-)

>2. What is the DB-9 jack on the VME bus cover?

A serial port

>3. Mine has TOS 2.06. Is there any better that can be installed without

Plain TOS 2.06 is just fine. There is no better, and no 'must have'
patches.

>4. Is the Atari host adaptor built into the motherboard? If

I'm almost positive that it isn't

>can it easily be replaced with an ICD AdSCSI Micro?

Yes. Mine was shipped from the dealer with a 105Mb drive running off an ICD
MICRO SCSI controller. This was all in the case instead of the Atari drive.

>7. What are some nifty things I could stick in that VME slot? Graphics
>boards? Ethernet (highly desired)? Is it equivalent to the internal
>bus connector present in MegaST's, or is it totally different? If different,

Definately graphics cards. Not much else really, although somebody
(probably in Germany) is likely to have done a network board.

>does the MegaSTE have an internal bus connector as well?

I don't think so. Definatly not a MST one anyway.

:-)

Hope that helps

Roland.

>
>IMHO none for our purposes. So, I agree with Jason.

Can I just add my thoughts to this too?

AFAICS Linux is just a big excuse in order to compile freely available UNIX software onto a PC. IMO Linux is also *needed* on the PC as DOS is so awful that porting UNIX applications to it is often a non starter.

However, on an Atari things are different. Sure in the past getting any 'foreign' software to run on it was a major PITN. However, with the advent of (firstly) Minix, and now MTOS (especially with the excellent GCC MiNT libraries), it is relatively easy to get much character based UNIX software up and running.

Several major problem.

1) No virtual memory
2) No memory protection
3) No X-Windows

The first 2 are non starters on the ST anyway (and are fixed under MTOS and Outside on the Falcon).

Number 3 is the only one worth bothering about.

Maybe its not a practical propositon, but how about porting X-Windows to MTOS (or even Mag!x)? With a bit of work it could even be done like most X-Windows emlation on the PC :- ie X-Windows in Native Windows (GEM in our case).

X-Windows can't be *too* hard. Most of it seems to have direct comparisons with GEM. I mean, I've even managed to port CBZONE (X-Windows B*TTL* Z*NE game) to GEM/TOS in only a couple of days!

:-)

1712. PC emulators?

Newsgroup: comp.sys.atari.st
Date: 1994-01-25 02:35:47 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.94Jan24213547@wpi.WPI.EDU>
Source record: 194302

Add me to the list of people getting MegaSTEs finally! (it seems like there are an AWFUL lot of us around here suddenly!)

I'm wondering about the 386sx VME board I heard about... Did it ever get anywhere? I'd like PC emulation better than PC-Ditto (which I have) for the occasional foray back into the world of DBase and Lotus... Yes, I switched from DOS to ST!

Anyway, can someone give some concrete info on PC emulators? I know of the following:

PC-Ditto
slow, software based, XT, 4-color CGA
PC-Ditto II
faster, hardware ????
PC-Speed
XT 4.77MHz, hardware, solder-in, ???
AT-Speed C-16
AT 16MHz, hardware, solder-in, mono VGA/CGA color
Supercharger
XT 4.77MHz, external ACSI, CGA ??

Can anyone fill in more?

thanks,
.s.

It was none other than Dino Dini that wrote on the 16 Jan 94 that ,
DD> From: amiga@hosta.dircon.co.uk (Dino Dini)
DD> Organization: Dini & Dini Productions
DD>
DD> Oh calamity! GOAL! has problems with certain (new?) versions of
TOS.

You're telling me !

DD> What happens is it crashes on some of the menus, producing
error
DD> colour bars (Black, Brown, Black). This is due to the failure
to
DD> allocate memory for an 'icon' (box) in the menus (about 70
bytes).
DD> This is even when there is 1/2 MB left!

Eh ? Won't even pass the boot test on TOS 2.06 .Won't autoboot at
all.
just goes to the desktop . Boot's OK on my TOS 1.2 .

And what's the problem with the Printer and MIdi lead's being plugged in
?
Lock's up at the start of the Game when they are attached . My feeling
is
that it's the disk protection that is the problem (With this and the
above)
since this is the usual situation with 'Virgin' released games .
Presumably
it is Their Disk protection method ?

DD> Anyway, an update of the ST version should become available when
this
DD> and some other problems have been sorted out. I will keep you
informed
DD> here.

Indeed ,are you going to include a Centre Circle ,get rid of the
dreadful
reference to DF0 (tut tut) ! ,allow the mouse to work properly , stop
random
lines appearing on the pitch , include the crowd sound's (as I understand
it
it was supposed to include more than just an ooh when a shot went wide).
Sort out the problem that if you choose Black short's you cannot read some of
the Half time stat's which seem to be set with that colour.Include the

pitch and surround's and what about a goal that look's like a goal. Apart from that I'd say that the gameplay is great :-) Pity it feel's and look's like a very poor port from the Amiga ,and one more thing why have you dropped the ability to load in Player Manager Tactic's ? Most dispointed in that .

Sorry to come over a bit strong ,I like the game (honest !) ,although I'm still inclined to play KO2 since I enjoy the tactic's bit . Just think you've underdone us on the features side a bit :-)

Oh and still dead keen to see a version of Player Manager 2 on the Atari :-)

Those of you out there that don't want to bother with this, can just
get the patch binaries from (I think) a.a.u.e in
atari/Mint/Misc/patch.zoo

The patch archive comes with two programs - patch and bpatch. Use the
bpatch one on the mint diffs.

ROM(s) fall under US copyright laws as 'software', and as such you have a
right to make backup copies of this 'software'. The law is very clear
about this. Some additions were added in 1991 that state the fact that
only one copy of the backup can be used 'at the same time', and that the
backup and the original can not be used at the same time.

I have my TT linked to a Sun via the MODEM1 port; I use Stalker for terminal emulation. I cannot work out how to download files - it is fine on the STalker end, but can someone tell me how to get the Sun to put a file out on the serial port?

> I have an st so for me this discusion is completely
>hypothetical.

Same here unless I bought a PC. I'll try to answer some of what you ask
from having observed other peoples systems.

>Is linux faster than the others?

Generally yes. It has a kernal which seems to be more optimized for the
PC architechture, compared to other PC unices which are more likely to
be ports from another architecture. Of course this may present problems,
for porting to the TT etc. but it wasn't designed to be run on the much
larger machines that BSD or MACH have in their heritage.

>Is it more stable?

It depends on the release (which come fairly frequently) but generally yes.

>Is it better (or more often) actualized? What does "It's FREE and often
>actualized" mean exactly?

Not sure myself :-) The development pace is _very_ fast and furious. Any
bugs get fixed very quickly. If you're looking for development support,
in that sense Linux offers _better_ support than _any_ commercial Un*x
via the Net.

>What are linux's advantadges over bsd-386 mach386 and hurd on pcs?
>In short, why linux?

One major advantage over all of these, is that it is _more_ standard.
Each of the above have particular idiosyncracies in the way that they
are designed. Linux is also the nearest to being totally POSIX
compliant.

These are my opinions only, based on what I have read and observed (no
personal direct experience though :-( ).

I totally agree with you... Okami was just fine until I installed MultiTOS.
It refuses to multitask efficiently, and sometimes even behaves strangely.
Avoid it in this case...

I tried to install the various TCSH , KSH, etc available
- TCSH works very well but is HUGE !
- alomost all the others have problems like:
requires slashed (/) environment pathnames
doesn't feature history (I find it essential) or full-line
editing (essential, too)
definitely doesn't match with TOS Filesystem.

I'm still looking for something reasonably big, working under TOS FS, secondary under MinixFS (I don't work with it, yet), giving at least line editing + history.

Only the CPU is at 16 MHz... the rest of the board is still at 8 MHz...
That's why the only speedup you can get is by using the cache. And even
with this, you get about 1.7 times the normal speed (average number).

Hello all ATARIers!:

Only a few words to dump my own experience over the net... I've
got an ATARI 1040STF since a long time ago; and recently I noted the
need to be able to connect to the big machines at work... I got some PD
software and a modem, and here are the results:

* Connections done through PSTN
* Modem: MultiTech (one of the V32 models, don't remember exactly
the model, but it's an external one, of course.
* Speeds: 9600 bps both RS-232 and modem.
* PD software: UniTerm v2.0e11, VT200 emulation.

Works fine! Note that I've got a monochrome monitor (SM124), so there's no problem if colors do or don't work fine... I can't see them!. Note
also that correctly configuring both modem and software at first is the most important step.

Greetings to all ATARIers and netters :-)->

>BTW, you are right about the manuals. Ringbound would have been much
>better.
More agreement from me, too! The binding is a bind. The functions reference
are in a strange order, so I have to look in the index first. The functions
aren't started on a new page like they were in the old manuals, so it's not
quite so easy to find something on a quick flick-through. BUT, the biggest
gripes for me are:
1) The command line options for the compiler are not conveniently
listed, I have to wade through stuff on the integrated editor etc to
find them.
2) Although it all claimed to be `up-to-date', the newer functions
(Speedo, AES4 etc) are documented separately (in the Modern Atari
Software book) to the old functions, so one has to consult at least
two manuals at a time.
3) WERCS cannot cope with new resource files with CICONs, eg it cannot
edit DESKCICN.RSC
4) Wrong bindings for several SpeedoGDOS functions.
5) The manuals are shite. I know I mentioned this already, but they're
so shite that I thought it was worth mentioning again.

They never ever mailed me to tell me that the upgrade from 5.5 was available,
I only got it when I asked Alex Kiernan at the Atari show `in' Manchester.

And I had two duff diskettes too :-(

Timeworks Publisher 2 comes with a PostScript driver. I do not know for sure, but I suspect that it won't work with other GDOS programs. And it definitely won't use GDOS bitmap fonts.

SpeedoGDOS still, amazingly, has no PostScript driver available. This is outrageous, and means that one can never use a Speedo program for quality output.

1737. help needed to install custom trap using GCC

Newsgroup: comp.sys.atari.st
Date: 1994-01-25 10:12:42 UTC
From: censjg@caledonia.hw.ac.uk
Message-ID: <1994Jan25.101242.20467@cee.hw.ac.uk>
Source record: 194328
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

```
Hi all,

I want to be able to install custom traps/exception
handlers from a C program.

A quick look at an assembler book suggests I should be able to do
something like:

lea _exception_vector, a0
les _exception_handler_func, a1
move.l al, (a0)

in supervisor mode. So, trying to be smart (read naive), I thought I'd
attempt this from C with something like:

8<---------------------------------------------------------------------

#include <stdio.h>

int trapAddr = 0xA8;
void trapFunc(void);

void
main(void)
{
static long install_handler(void);

Supexec(install_handler);

getchar();

asm("trap #10");
}

static long
install_handler(void)
{
asm("lea _trapAddr, a0");
asm("lea _trapFunc, a1");
asm("move.l a1, (a0)");

return 0L;
}

void
trapFunc(void)
{
printf("\n\n*****\tBoo!\t*****\n\n");
```

```
getchar();
}
```

8<----------

This compiles ok (gcc-2.5.7, gas-2.2), and seems to install ok, but I get a full screen width line of bombs when it calls the trap. I know it should probably do an rte back from the trap, however it doesn't get as far as printing the message. I tried putting printf's in to see what the program was putting into the exception vector address, and I think it's ok, but still doesn't work. Should I be concerned about relocation (didn't think I should...), any other suggestions (apart from 'learn C':)?

(Should have said I'm actually cross compiling on a Sun3)

email preferred.

laserdemo.tos is already a self extracting archive, compressing it makes it
bigger. Find a site which has it uncompressed (ftp.uni-kl.de /pub/atari/falcon/
gfx_demos I think)

Also some sites will auto decompress the file when they transfer, I think ic
did this to me. So you might not actually need to decompress what you got.

ps Its a great game, I hope a fuller version comes out.

Tom.

Hmmm ... this reeks of flame bait :-)

Linux is pushed by lots of people as the greatest thing since sliced bread;
thus, everyone and his brother has it. This is very important for those
poor souls without network access.

IMHO *bsd is technically superior, but this is arguable. For the whole deal,
check out the comp.os.386bsd.* newsgroup.

A hint for German-speaking readers: reading iX magazine is *not* enough.

It isn't a waste of space when you have a Panther which can use 10 tons of
fuel to reach the space station.

>(try the disputed systems around -3,0 for lotsa things to kill)

Try Riedquat (-3,-6). Lawless system, so you can carry out assassinations
there without so much as a fine. And the number of pirates who seem to think
I'm easy pickings...

>Sinister Software's version of Centipede works fine on my Falcon.
>Have you tried Backward with it?

I took one look at Backward and decided it was a horrible messy way or
getting games to work on the Falcon. I'd rather do without something like
this and wait for someone to code something decent. I still dream of Moon
Cresta coming out for the Falcon.

At first you get to deliver messages, then medals, sercret documents and high command orders, basically similar but getting more dangerous, later you can get assassinations, and 'blow up a space station' missions, and escort duties and so on.

> Is the protection case-sensitive ?

No.

> I don't think you ought to be able to select targets for homing in on
> when the game is paused ... Makes fighting too easy.

They probably found it was very difficult to target something whilst dog fighting. If you don't like it, you don't have to use it.

Uh? I do save after accepting a target, I do save on the morning my target
takes off, I do save again after I've hunted him through hyperspace. No
problems, all targets showed up (I had to restore once or twice because
their ships flew to another base in the same system, next time, they jumped).

i`m used to work on a sun sparc station10. there you have to do a login (user and passwd) and then the user interface will be startet (openwin).

now, i'm wondering if this is also possible on a falcon030 with minit and minixfs. first you have to log in and then gem will be startet.

has anybody tried this? if yes, what do i need? does it run on a falcon?

Hi Stephen,
>Has anyone not had targets for assassinations not turn up at the stated
>place/time ?
I never had these problems; some friends did. In all cases, the cause of
this annoying experience was a mistake by them:

a) Don't hang around starbases if you've got a criminal record. A clean
status is not enough, target will not appear or dock again. Try
launching *AFTER* your target has jumped into hyperspace (works only
on surface ports) or keep a clean record ...

b) Don't leave the target system for anything except chasing your target
through hyperspace. If you do leave the system before your date, frontier
will store the job as failed.

Happy hunting :-)

> a TT but doesn't mention the Mega STe (it probably wasn't out
> when the 3.0 Spectre was released). Has anyone with a Mega
> STe and coprocessor confirmed it works?
My MSTE has a 68881. It (the 68881) is not recognized by Mac programs running under Spectre 3.0. Presumably that's because the 68881 doesn't really function as a coprocessor with the 68000 in the MSTE, as it would with the 68030 in the TT. With the 68000 the floating point chip behaves like a _peripheral_, using the Atari SFP004 board (I may have the name of the board slightly wrong).

> How much should I pay for a coprocessor? Every place I called in

Using a good shell that does redirection properly, try this:

patch -l < diff1819.txt
patch -l < diff1819.spp

-l means "check things loosely", so things like extra spaces or wrong
end-of-line characters shouldn't bug you.

>
>Are there any programs that are able to display colour ansi graphics on my
>1040STE?

CoNnect will display color ANSI, using the number of colors of the resolution (i.e. 4 color ANSI in ST Medium, etc). Another small program called Minit933 (or something like that) also does the same - it's more of a "bare bones" program but does the trick.

For a full 16-color ANSI on a normal ST/e, you might try ANSITERM (I forget the latest version number)...

STalker might also support ANSI (I'm not sure as I don't have it)...

>I currently use Uniterm 2.0e but I don't think it supports colour ansi
>only mono....

Technically VTxxx, but pretty close...

>Also does connect now run ok in med res?

Always has. If you want a "full 80x25" screen display in medium resolution, all you need to do is set the font to "system font 8pt" (from the Display menu) and turn off the scrollbars (from the Terminalsize menu). It's not bad on a monitor, but probably a little tricky to read on a TV (but then, what isn't :-)

Rob

...of the three above-mentioned, if you want overall power, go with CoNnect - if you simply want full-color ANSI (on a normal ST/e) go with Ansiterm (or CoNnect in ST low)

Yes, the TT with suitable amounts of FastRAM and a good graphics card
is better, faster, and more expensive than a Falcon030... Except that
you don't get a DSP, and the sound is nowhere near as good, no SCSI
II, ...

Having a graphics card should eliminate the Falcon bus slowdown in
higher colour modes.

One more (possibly major!) problem might be that you will find it even
harder to find a TT in the USA than a Falcon.

Are there any benchmarks comparing FastRAM TTs with Falcons?

```

You are *not* setting the vector for trap #10, but rather
storing the address of trapFunc into the variable trapAddr, as if you
have written

```
trapAddr = (int) trapFunc;
```

(assuming 32 bit int's). You can use Setexc() to set exception
vectors (don't forget to #include <osbind.h>):

```
Setexc(0xA8, trapFunc).
```

I have a Falcon myself. It is slower than the TT, but has the advantage of
running the latest version of TOS (AES especially). If you are not
interested in the audio side, then a TT is probably the machine to go for.

>> better.

>As noted above ring binders would be much better (GFA Basic style).

I like the ring binders HiSoft usee for their SpeedoGDOS package. Page flipping is so easy with these rings. But Wordflair II from HiSoft also has rings, but these are these black closed rings, which make flipping a lot more difficult. This is something which developers really need to look at. The best manuals are not only written very clearly, but are also easy to browse. Best of all easy to browse manuals last a lot longer, because one does not have to push and pull all the pages round the rings.
One other thing that pleases me about the SpeedoGDOS manual (from HiSoft, I don't know how the compo one is) is the quality of the paper used. It is this shiny smooth type of paper which gives very good print results. My Wordflair II manual on the other hand looks like it was photocopied onto recycled paper. Guess which manual I like better. (Note that the content of the Wordflair II manual is excellent, it has many useful examples and short readable paragraphs).
So now developers know how I feel about what manuals should look like. I hope others will give their opinion too, so that us users will get more value for our money.

Erlend.

P.S. the speedo manual is not my favorite manual. My favorite manual is the STeno manual, because it is published so well. It has some nice useful illustrations, clear text and although it is bound with staples, it is still easy to use because it is small and uses decent quality paper.

1765. Interesting Dhrystone results

Newsgroup: comp.sys.atari.st
Date: 1994-01-25 15:42:50 UTC
From: csulw@csv.warwick.ac.uk
Message-ID: <2i3elq$n2c@crocus.csv.warwick.ac.uk>
Source record: 194350
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Living in a house at university where the occupants all own different types of computer causes a few arguments, mostly about speed. To settle this we decided to compile the dhrystone V2.1 code and test our machines. All were compiled with Gcc 2.4 or later with the -O2 flag. Here are the results:

386/20 4550 - 5000 dhrystones/sec
Acorn A410 ARM3 10000 dhrystones/sec
Falcon030 1500 - 2500 dhrystones/sec

Does anyone know why the results vary when the number of tests is altered? Also, we were under the impression that a Falcon was at least as fast as a 386/20. What has happened?

Thanks for any suggestions.

Paul

1766. HELP: Questions about ADHI...

Newsgroup: comp.sys.atari.st
Date: 1994-01-25 15:45:18 UTC
From: vij@vnet.ibm.com
Message-ID: <2i3eqe$h2o@tornews.torolab.ibm.com>
Source record: 194235
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I think my first attempt to post this got lost... trying again...

Hi All,

I've got some questions regarding the usage of
Atari's hard disk drivers and their features...

Some background: I've got a Mega STE with TOS 2.06
and am currently using ADHI 5.00 and HDX 5.00
I've recently downloaded HDX 503C, HDX 504,
ADHI 605C, AHDI 606, and ADHI 6061.

I'd REALLY appreciate ANY answers to the following
questions. I know that there are others out there
with similar questions too...

1) What is the "best" ADHI and HDX to be using?
Are there any versions to stay away from?

2) I assume it's ok to use the latest HDX with
my MSTE, but how about AHDI? In one of the
readme files, they mention the Falcon but not
the MSTE. Is AHDI 6061 Mega STE friendly???

3) What are the differences between AHDI 606
and 6061??? (ie: was something in 606 broken).
There was no readme with AHDI 6061.

4) Assuming I'll move up to ADHI 6061 (or whatever),
how do I do it? Do I just use HINSTALL to
de-install the current driver and install the
new one? Do I need to reformat or anything,
or is it as easy as copying SHDRIVER.SYS to
by boot partition?

5) What's the relationship between SHDRIVER.RAW,
SHDRIVER.SYS, and AHDI.PRG? For a given version,
all three files are the same size. Are they
just renamed versions? It's my impression that
HINSTALL uses SHDRIVER.RAW to create a SHDRIVER.SYS.
I'm not sure what ADHI.PRG is used for...
The reason I ask is that AHDI 6061 just comes with
ADHI.PRG (ie: know SHDRIVER.RAW).

Thanks in advance to anyone who can help. I'm kinda
living on the edge 'cause I haven't backed up my

hard drive yet (I know, I know) and I don't want to
trash my drive when upgrading...

VIJ...

: Bollocks. If a diskless 68030 16MHz UNIX workstation (HP9000/330) can
: run X without problems (I have worked on those for years) then a Falcon
: should be quicker at it, because it doesn't need to send everything
: over an Ethernet connection.

I agree. There is no reason, apart from apathy, that Linux shouldn't be
ported. I for one would be happy to help - but not until June (my degree
is starting to give me lots of work to do!). I suspect this is a similar
problem for other netters too; but IMHO GEM can't hang on for much longer
- I don't know if X is the answer though. If a port of X is too slow,
then we re-write it, in Assembler if necessary - let's not hang around
saying it cannot be done!

What's the difference??? OK, sorry... I just couldn't resist this one. :)

>A CD-ROM is a bit like a _HUGE_ floppy disk with the write-protect on;
>you don't need to copy things from the floppy to your hard disk before
>you use it, do you?

Usually this is true, but their seems to be a trend to the opposite. On Macintosh and Windoze systems, for example, almost _nothing_ is designed to be ran from floppy, and very few apps can anymore. Rather the programs must be installed and executed from a hard disk. No wonder that common hard disk capacities keep going up and up. Fortunately for us, HD prices keep going down. :)

Can you get a TOS version without buying ROMs OR an Atari computer w/
ROMs? Not legally.
Can you get Mag!X to work on an Amiga? Not very likely.
So, where's the point?

|> Andreas Schwab "And now for something
|> schwab@ls5.informatik.uni-dortmund.de completely different"
```

While that may get the addresses stored it does not address the real problem. The real problem being that a trap comes under the heading of EXCEPTION processing in the 680x0 familly and you need to perform an RTE instruction to properly return, instead of the standard RTS.

Since I do not know how to identify a C function as an exception handler, I would recommend that your function use an exception wrapper, written in assembler, to fix this problem.

```
EXP_RTN:
movem.l d0-d7/a0-a6,-(sp) ; save everything!!!!
bsr your_function ; maintain position independence
movem.l (sp)+,d0-d7/a0-a6 ; restore everything!!!
rte
```

Then (assuming you are in supervisory mode):

```
main()
{
void * trap_10 = (void *)0xA8L ;

...

trap_10 = EXP_RTN ;
...
asm("trap #10");
}
```

If some one knows how to implement exception handlers in C code for the ST they can help you even more.

I recall that I once received a patch that was not accepted by
any patch binary I could locate on any Atari ftp site. So, I
finally took the patch sources from prep.ai.mit.edu:/pub/gnu and
compiled them on my TT (gcc 2.4.5). I hacked the makefile
manually (has anybody ever managed to successfully run a
./configure script on an Atari system?), it didn't need many
changes, though. The binary worked flawlessly for me right away.

If anybody is interested, I can check out the details.

In the last issue of the German magazine "ST-Computer" there was
an article on a X/Windows client for the ATARI.
If I remember correctly, it depends on an ethernet-adapter on
your VME-bus (so you'll have to own a TT or such). Your ATARI
can then be used as a X-Terminal which is hooked to a `real'
UNIX machine.
The difference between this implementation of X11 and the one
with the ATARI System V is, that the first needs a host on which
the application is running and only displays the output, whereas
the latter really runs X11 as a display for the applications that
are running on your ATARI.

It would be very nice to see a X server that replaces the VDI.
So you could yust recompile some UNIX source code and have some
sort of standard. But then X/Windows is *big*. On the SUN stations
the image of the window system is somewhat around 8MB! So let's
use the ATARI as a small but fast computer!

The easiest way is to format 720K disks on the PC and then copy the data
files on the ST to the PC disks. The STs can read/write DOS disks, but not
necessarily the other way around. Or you can always do a serial transfer
via communication software (tediously slow, however).

Did Dragonware ever release AtariTalk2? It was to be a Spectre INIT
which would let the MSTE/TT's LAN port talk as a real, working
Appletalk port from what I understand...

Also, is there word on Spectre 3.1? Apparently it was to be shown at
ToadFest, but I haven't heard a word... What will it include? Will
it ever come? The last Spectre update I know of was January '91!!

1787. Falcon monitors

Newsgroup: comp.sys.atari.st
Date: 1994-01-25 20:49:27 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <94025.154927STIRRE31@MAINE.MAINE.EDU>
Source record: 194230

Hi all. I just ordered my Falcon from Computer Studio (yeah!)
and have a quick question. Is it my understanding that the Falcon
uses VGA monitors. Will the Apple VGA monitor work well in
all Falcon resolutions? I am planning to buy an Apple monitor
because of educational discounts I get as a college student.
Also, I would just like to point out that mail order permission
is not difficult to obtain. I'm in Maine, ordering from
North Carolina. And Computer Studio got permission for me. I
never had to deal with Atari. So, if that was a reservation
to getting a Falcon....
Thanks,
Scott Tirrell

Message-ID: <CK7Eo5.uF@usenet.ucs.indiana.edu>
Source record: 194224
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm aware that there exists single-floppy C compilers and the like for the ST, but I would much prefer to use the UNIX powerhouses here at school for compiling. It's no problem downloading, debugging, etc.

what I want to know is if you are USING a UNIX-based GCC or G++ to cross-compile for the ST, or KNOW the details, can you help me build one on my machine?? I'm not an idiot (?) , but just telling me to use the mintlibs or the diffs or whatever isn't specific enough, as I've never built a compiler before.

any help would be greatly appreciated.

thanks

david

1790. Hard Drive Utilities For Falcon?

Newsgroup: comp.sys.atari.st

Yes I do! What is more I have written a nice little sprite extension which basically brings all the advantages of machine code sprites to STOS. Well, it needs to be debugged and tested out (and the compiler extension made up) so sometime at the end of Summer it should be ready. As a little foretaste it gives:

As many sprites as you want (well to 65535 anyway)
Faster sprites (it plots in bulk - not individually)
Full collision detection
Full background collision detection
'Invisible' sprites (not as daft as it sounds - honest)
Full user control of sprites - ie no probs with screen swapping etc.
as it's not interrupt driven.
Sprite offset command (for multi-screen games and easy scrollers!)
A PlotSpr which works properly
Close syntax to the STOS sprite commands
Commands to synchronise sprite updates
Other twiddly commands which return the current frame of an animation
and stuff like that.

STOS is not dead! Long live STOS ...

Hi,

I have an old ST game called "Sex Vixens From Space" by Free Spirit Software. Problem is I lost the docs and I need them for the password to play the game. I contacted Free Spirit Software and they told me I'm on my own because they no longer support the ST only IBM Multimedia Applications. Anyone out there who has this could you please photo copy I think it is the first two pages of the docs contains the passwords. I can photo copy the diskettes to prove I have an original copy and not a pirated one.

From: Joseph_Hogan@UQAC.UQuebec.CA
Message-ID: <9401252255.AA17402@infocom>
Source record: 194234

Hello,

I am in the market for a new modem to replace my almost 5 year old
Supra Modem 2400. I thought about the 14400 baud modems since the
prices are dropping rapidly with the onset of the new, faster
technology. I have been told that the following modems are good,
but I would like some feedback from users about use of the unit. Also,
I would like to hear from users of Flash II and what kind of success
they have had with there modem.

Supra
Practical Peripheals
Zoom
U S Robotics

I would like to know warranty info, and other stuff too. If there are any
other modems out there, please let me know.

I want to get a modem/fax, so add that to the list of features to look out
for. I am only going to be using this for home use, not for a BBS. I have
read other posts about different modems if you are going to use it for a BBS,
and leave it on for extended periods of time.

Thanks for anything you can say,

Joseph Hogan

Source record: 194248
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

>386/20 4550 - 5000 dhrystones/sec
>Acorn A410 ARM3 10000 dhrystones/sec
>Falcon030 1500 - 2500 dhrystones/sec

That Falcon figure just doesn't look right. far to low.

For comparison, tests I've done/seen are:

386DX/25 8000
Acorn ARM 3 36Mhz 17000
STE 25Mhz 2700
MSTE 2000
STFM 1300

These are only approximate figures, and were not all done on the same C source version of dhrystone so are not *strickly* compariable.

I'd expect the Falcon running single TOS in ST Hi Res to make at least 4000.

Roland.

>s
>available on ST's that are higher than 16 Mhz (let's say 32 or 50) ?

I think 36Mhz is the fastest you can get an ST to run at. As for upgrades
to STEs and MSTEs, I've seen an ST at 25Mhz, but no MSTE faster than 16.

A MSTE is only about 1.7 times faster than an STE so PC DITTO (if it runs
at all) will only do about 2Mhz, which is still not fast enough :-(

Roland.

1808. Making GIFS

Newsgroup: comp.sys.atari.st
Date: 1994-01-26 02:36:23 UTC
From: dwallace@wam.umd.edu
Message-ID: <2i4kv7$v2@cville-srv.wam.umd.edu>
Source record: 194153

One of the cool things I used to do when I was a co-sysop on an IBM textfile board was draw up some really nice ads on my ST, convert them into .SPC files, and use a utility to turn them into .GIFS from there. Thus, all of my IBM friends could see the fruits of my artistic labor. I haven't done this for a while, but I currently have some atari pics I want to zap to a PC friend. The problem is, I am now on an STe, and Spectrum will not run on it. Thus, I am unable to get my .PI1 files into .SPC format, and consequently cannot run my .SPC -> .GIF converter on them.
Does anyone know of a solution to my problem? The most elegant solution would be a simple utility to convert directly from .PI1 -> .GIF, but any other ideas for how I could get a picture into .SPC format would be most appreciated. Please respond via e-mail. Thanks.

:
: ROM(s) fall under US copyright laws as 'software', and as such you have a
: right to make backup copies of this 'software'. The law is very clear
: about this. Some additions were added in 1991 that state the fact that
: only one copy of the backup can be used 'at the same time', and that the
: backup and the original can not be used at the same time.

:
: Jim Drew - CEO - Product Engineer - Utilities Unlimited, Inc.

And let's not forget that TOS has been distributed on disk -- buy an
original disk, and you buy the 'license' to use it. Since many of the
early Atari users upgraded to ROM based systems, these disks are
readily available. So ROM sockets are not required for legality.

] What about Geneva? If I could recall correctly, it dos not require
] TOS. Maybe I am wrong.

Geneva is just a software replacement for the AES, (The desktop basically, although there is more to it than that). It basically just gives TOS 'add-ons'. It still uses what was already there though!

It is a sort of half-way upgrade to TOS 4.xx. with extra bits (such as multitasking), and missing bits (Desktop :)

Not a very good explanation, but there you are! 8-)

Dons flame-proof suit.....

I've got the following ST stuff for sale. It's all in good shape and all the boxes and manuals are included (except where noted). If you don't like the prices, make me an offer.

- Magnavox 1CM135 14" stereo color monitor. Includes cable for the ST. For ST low and medium resolutions. $225
- Atari SM124 Hi-Res monochrome monitor. $100
- Practical Solutions Monitor Master. Switch between monitors without switching cables. $10 or Free if you buy both monitors. (NB)
- Several Atari manuals, including Mega ST, SH Hard Drive, Megafile Hard Drive, and ST BASIC Sourcebook. $5 for all.
- LeaderBoard Golf with Joystick Dongle (not for TOS 2.06, but okay with 1.62 or earlier) $5 (NB)
- Populous and The Promised Lands Data Disc. Not for STe's. $10
- Greg Norman's Ultimate Golf $10
- Q-Ball 3-D Pool $5
- Driving Force driving game $5
- Timeworks Word Writer ST $10
- ST Copy - $2 (NB)

NB = No Box

I can be reached at home in the evening (CST) at (708)882-5418, or reply to this message.

Hi! I am replying to your post for two reasons, 1- I miss singapore.. I had 8 days there last summer and loved it.

2- I have a TT030, and there are numerous differences, the 030 for one. THe external ports are also handled differently, and I believe that if they do not release the software into the public domain, or change it to run on the TT030, your only hope is to try to disable the cache, try the 24bit patch programs out there. Also try to see if the CPX is not screwing up you configuration. I hope this helps.

A friend of mine is looking for a 1040STe to buy preferably with
a hard drive as well - at least tested with a hard drive to ensure
no DMA problems (the first batch had some problems I understand)

I am looking for a TT - I know Atari is producing them again but
I would like to know if anyone wants to sell theirs - a 19" monitor
is a must.

Thanks,

Hi,

>>I'm looking for a postscript driver for gdos, preferable one, which
>>can also write to a file.

[...]

>SpeedoGDOS still, amazingly, has no PostScript driver available. This
>is outrageous, and means that one can never use a Speedo program for
>quality output.

There is a pseudo-solution to this problem, in the form of a program
called mfps (metafile to ps). It converts GEM metafiles to PostScript.
I have only used it a few times, so I can't vouch for its quality. It
did have problems converting one rather complicated metafile created
by EasyDraw, but it has worked for several simpler files.

I got my copy from a PD distributor before I had net access, but it
should be available from the standard archives.

1 Spectre GCR Cartridge.

Mac-Plus emulator. Includes several versions of the software (Including versions from the Spectre 128, and the current v3.0). The Mac-128K ROMs. Spectre/Drive-Port interface cable, lots of documentation including quite a few newsletters & hints 'n' tips sheets.

Wanted, $520NZ, or $260US. Shipping is included in the price, please leave me an E-Mail if interested.

Has all the original boxing and manuals etc.

Has a couple of different Mac System disks as well. (6.0.3, and some older versions).

I've been doing this since ... 1987. Works great, as long as you can tolerate
the transfer time getting the actual binaries down to your ST.
>
>thanks.. and any recommendations for a good book on GEM/TOS
>programming would be helpful, too. I have the atari compendium btw.

I started programming on the ST with Mark Williams C 2.0, and except for the
newest stuff, I still find myself referring to their manual most often. For
other info, I have the Sybex Programmer's Guide to GEM, as well as the Compute
series of ST books, a couple of the DataBecker manuals, and the Concise Atari
ST Reference manual. As well as the Atari Developer's kit. But actually,
since I bought the Compendium, I haven't used the others lately...

>any help would be greatly appreciated.

If you've never even built the GNU compiler before, then I suggest that the first thing you need to do is get the full compiler source and build a native version of it on the Unix box you're going to be using. This is a relatively simple process, but if you haven't even done that then it's far too soon for anyone to be telling you what changes need to be made so you can cross-compile for the ST. Once you're familiar with the build process, and once you're confident you can create a compiler that will work *native* on the host you're using, *then* you can think about setting up the cross-compiler. You will need to use the native GCC to build the Atari cross-compiler.

If you've never used the "patch" program to apply changes to a file, you'll need to hunt that down and read about it as well. Once you've gotten this far, you won't need any help configuring the GCC source as an ST cross-compiler.

You will need to grab the C library and include files as well, so you can build the Atari C library on your Unix box, and use those include files when compiling your own programs.

Everything you need to create a complete development environment on a Unix box can be found in the Gnustuff directory on atari.archive.umich.edu.

About TT's, I think last I heard Midcities had one with a 19" for sale, not new, but with 16 Meg's of RAM, you might want to call them. I don't have the number handy, but if you want it, please email me.

On another note, what of the TT Production? I know some Retailers have been literally waiting for months...for TT's as they ARE in demand. Heck, I'd buy a new one if I COULD...

Anyone know the latest news? I heard that the TT was meant to be in production again, but it's been a very long time now, dealers in Germany have also been waiting for a very long time, and not gotten any.

Cheers

> Are there any versions to stay away from?
>
HDX is the package ATARI uses to format and partition the Arari hard
disks.
It should be generic because the support for a particular HD type is in
the ascii
file "windcap". Hence the support for a new HD type can be added by hand
there
How this has to be done, I don't know ?!

AHDI is the the HD driver.

>4) Assuming I'll move up to ADHI 6061 (or whatever),
> how do I do it? Do I just use HINSTALL to
> de-install the current driver and install the
> new one? Do I need to reformat or anything,
> or is it as easy as copying SHDRIVER.SYS to
> by boot partition?
>
I made several tests with HINSTALL and it seems simply to copy the
SHDRIVER.SYS file to the HD, or remove it when selecting de-install.

>5) What's the relationship between SHDRIVER.RAW,
> SHDRIVER.SYS, and AHDI.PRG? For a given version,
> all three files are the same size. Are they
> just renamed versions? It's my impression that

> I'm not sure what ADHI.PRG is used for...
> The reason I ask is that AHDI 6061 just comes with
> ADHI.PRG (ie: know SHDRIVER.RAW).
Renaming AHDI.PRG (V6.061) to SHDRIVER.SYS and using HINSTALL
showed that my HD seem to boot with the new driver.

Beside this I noticed that since the ADHI Version 4 the driver wants
to read some identification from the controller. And does not recognise
controllers anymore like the one from VORTEX. I have a SH205 (20M) and
a Vortex 30M. I am only able to access the VORTEX (my 2. driver) with
AHDI V 3.01 above this version I can only access the original Atari HD.

regards
Andreas Pauletti

I am an official FS beta tester, and to get versions above version 2, the latest being indeed version 5, you had to sign and post back to him via normal post a contract of non-disclosure, and non-distribution.

Since version 5 I have not been informed of any new versions, and no reply has been received from the messages I have sent him.

I'm now running under BlowUp Hard II instead, with a slightly smaller resolution, but no over-driving of the monitor.

Does the 3.0 software notice the AppleTalk compatible port on the MegaSTE
?

Just wondering, since I recall reading a blurb about AppleTalk support in
Spectre w/Gadget's AppleTalk add-on board. Don't know if it ever came
about. Certainly never saw an update to Release 3.0...

I have made some Dhrystone benchmarks months ago (there was a "discussion" in
.advocacy ;-). These are the results:
F030, TOS 4.01, 640x200x2 (60 Hz): 2777 Dhrystones.
The resolution is very important, for example:
F030, TOS 4.01, 640x240x256 (60 Hz): 1851 Dhrystones.

I have also checked the Falcon without Caches. If you switch the caches ON
you will only get a 15-25% improvement. This does NOT fit in the tests I have
made with some Standard Applications. The avarage improvement in "real life
situations" is 72%.

Result: The Dhrystone benchmarks aren't Cache-friendly (they don't seem to
fit in the F030-Caches). As the F030 only has a 16 bit data-path to the
memory, the results of the benchmarks turn out bad.

TOS 1.0 (and .99 and .98) were distributed on disks. If you really want
to use them...go for it. I'd prefer 2.06/3.06.
The only problem so far is that there is only the modified 3.06 in the
Medusa T40 that works w/ 040 processors.
One could also try to get Mag!X to work...but this OS doesn't even run
on a Falcon (perhaps v2.5 or v3.0 will).

1831. Falcon SCSI II HDD question (simple)

Newsgroup: comp.sys.atari.st
Date: 1994-01-26 09:20:47 UTC
From: h54118@sakura.kudpc.kyoto-u.ac.jp
Message-ID: <h54118.759576047@sakura>
Source record: 194162

Hi,

one simple question about SCSI II HDD's for the Falcon:
Can AHDI or whatever lives on the Falcon by default, handle
any HDD as long as it's SCSI II?

Or do the drives still differ and need special drivers?

I'm asking because here in Japan there are of course no HDD's
available which are approved for the Falcon...

So: Do I have to order from an Atari-country or can I buy here
as long as it's SCSI II?

Many tnx in advance,

Christian

>
> SpeedoGDOS still, amazingly, has no PostScript driver available. This
> is outrageous, and means that one can never use a Speedo program for
> quality output.
Could you please explain that to me?

I dont see what quality has to do with the format.
The main differences:
- dithering: with Speedo the program has to do what PS does,
but the program can do it at the same quality
- resolution: In Speedo the fonts are stored in a higher resulution
than PS fonts (16:1)
You CAN SEE this difference, if you are printing with > 300 dpi
(with good printers).
You can see edges in the characters where they mustn't be.
And it's a fault of PS, not of the printer.

use the list files in the archive command in lharc or arc etc, then
tell it to extract one (or use a wildcard for some of them?) of those
files in the archive at a time.

> and stuff like that.
>
>STOS is not dead! Long live STOS ...
>
Ive just written an extension to add a switch construct to Stos as well as
a command to read from a parallel port joystick adaptor, a command to write
a string to memory as well numerous other useful commands . Its just been
uploaded to Atari archive along with the blitter extension in blitter.zip.
There is a new version of Stos fix in Atari archive which claims to make
Stos run perfectly on the falcon . Its called something like stsfx27.lzh.
This is NOT the same as the program of similar name from Mike Horwell.
It is written by a different person.Due out shortly is an extension which
allows you to draw windows 3 style dialogs,windows and fileselectors.It was
due out at the beginning of january but I haven't seen it advertised yet.

There have been lots of new extensions released in the last few months
including the extra extension which adds about 40 new commands to stos including
the ability to access the cookie jar , the ability to mirror areas of screen and
a command to put strings on the screen in replace mode . An extension called
the Quick extension has been released whcih adds rapid horizontal scrolling to
stos .All these extensions can be obtained from the monthly Stos disczine which
includes articles from stos programmmers Billy Alan and Colin Wat of Top notch Software .
You can get it from most english Pd libraries or email me for the address of the
editor.

A stos mailing list is being set up at the moment.

Long live Stos

Well my opinion is don't! ... unless the majority are not uudecoding
on their ST's.
uudecoding the stuff off alt.binaries.pictures.* isn't all smoove sailing,
quite often I have to take to files with a text editor and paste all
the bits together... with the "include..." system used on the atari,
you don't need to bother because it knows it's finished with part one,
and know what it's looking for in the way of part 2

Use the ZMODEM protocol for it. There is a Shareware ZMODEM for Unix
workstations on most ftp servers. It's easy to compile and works fine. I
once used it to transfer data between the TT and a Sun.

Source record: 194188

Simon Wilkinson asked:

"Does anyone know why IconDesk (German PD package) icons
become corrupted when using Warp 9 screen accelerator? "

I do not know the exact reason, but evidently Icondesk is doing
something not altogether above board. I was using Icondesk myself,
with a demo of QuickST 2.0 (or was it 2.1?) and it worked fine. When
I purchased QST2.21, Icondesk "broke", and as you have noted, still
fails work properly under QST's successor, Warp 9.

If you are looking to spend the money for NVDI to cure the problem,
consider a commercial desktop like Neodesk or getting TOS 2.06 for
your machine. If you want another free solution, look into Teradesk
or KAOSDesk. (I believe both are freeware, rather than shareware, but
I am not 100% certain).

|>
|> Roland.
|>
|> @CiX
|>

I have tried to install Elite II on my Falcon's hard drive; it doesn't work. The game only seems to flicker when in 4096 colour mode, it is fine in 512 colour mode. BTW does anybody know where to get a class 4 or better Military Drive?

And what about all the bugs in the game, or is it just my Falcon??

1. File selector doesn't work properly.
2. If you are flying under auto-pilot with time compression at max, and you fire your lazer; internal fuel tank runs out.
3. Assasination to do at some place, and he/she doesn't show.
4. Bulletin board is corrupted with stockmarket items.
5. Not being able to keep mouse button down on 'repair hull damage' and selling items eg robots via the bulletin board. (who wants to have to buy a new mouse every few weeks!?)
6. Auto-pilot never reaching destination (it is always a few thousand km's away).
7. Having to 'click' on the screen to make space stations etc to appear, so that you can then set the auto-pilot.

Thats all I can remember.

Will there be a Falcon version, with at least better sound (like the AMIGA version), the sound is bloody awfull on the ST version!!

Kev.

The games writers manual gives the subject a vague mention.I assume you
want a subroutine which can be accessed by many functions . You could try
placing it in the data area , it would be easy to calculate its offset
using the debut variable and then jump to it.If you like I can photocopy
the relevent pages and send them to you.

Can I have a beta test copy of your sprite extension?

This sounds very similar to the missing link bobs , how does it compare
speed wise to them ? Do you have to preshift all the images? What is the
maximum sprite size? Can you choose how many bitplanes you plot? etc..

You wouldn't really want to run an X server on your Atari...

MiNT is a much better UNIX than Linux on an Amiga; at last count, the
Amiga port of Linux would sorta just sit there and idle. Sure, that's
some accomplishment, but not terribly useful.

At least with MiNT you can get a real filesystem for your Atari (bye-bye
DOS filesystem, thank ghod!), you can multitask in a reasonalbe fashion
even on a wimpy 8Mhz 68k, you can use ports of tonnes of UNIX utilities
and apps, etc...

HINSTALL installs SHDRIVER.SYS to the root directory of the boot
partition of the HD, but that's not the whole story. It also
changes some internal info on the HD that makes it bootable (when
you install) or non-bootable (when you remove). Simply copying
SHDRIVE.SYS onto your HD won't make it bootable, and deleting it
will likely cause your system to fail during booting (should be
easy to fix after booting wit the Alternate key depressed,
though).

>Beside this I noticed that since the ADHI Version 4 the driver wants
>to read some identification from the controller. And does not recognise
>controllers anymore like the one from VORTEX. I have a SH205 (20M) and
>a Vortex 30M. I am only able to access the VORTEX (my 2. driver) with
>AHDI V 3.01 above this version I can only access the original Atari HD.

I don't know whether you suspect this, but the SCSI ID that AHDI
tries to obtain during booting don't seem to have any influence
on its further operation. The names are simply displayed while
booting, probably so you can figure out what devices were found.
When a device doesn't return an ID, such as a Megafile 60 (which
harbors some ugly, 5 1/4 inch non-SCSI HD), AHDI says
"Identification unavailable", but continues to work.
I don't really know, but the Vortex problem *may* have to do with

the WINCAP info. Then again, I faintly recall having read about
third party hard disks that don't support the ACSI protocol (i.e.
the ACSI commands) fully, and that operating such HDs with AHDI
may lead to data desasters -- so, it might also be that AHDI
refuses to access the Vortex disk deliberately.

>as fast as a 386/20. What has happened?

It is well known that the Dhrystone benchmark is poorly constructed. Due to an error in the way the original analysis of program data was carried out, Dhrystone basically reduces to a test of how fast string operations are implemented.

Using the same compiler was a good idea. Since you were all using gcc, you should have all had the same string library (libgcc.a) -- check and make sure. Also, using different versions of gcc is a bad idea: you'll get differences there.

I also don't recommend the use of -O2. The point of doing a benchmark is to see how long it takes to execute some code. If you switch on heavy optimisation, your compiler may well remove code that the benchmark is trying to measure!

One problem with small benchmarks like Dhrystone is cache effects.
If the program and/or data happen to fit into the cache of one machine, it will have an advantage over a machine where this is not the case. I suspect that this is probably the cause of your problem (and if you turn off the optimisation, code size will probably increase and change the cache effects again)

Finally, make sure you eliminate all other activity while running the benchmark (this can also affect the cache). This includes interrupt handlers (turn off interupts) and bus contention (e.g. video access).

Mat

PS:
I did an in-depth study of benchmarks and benchmarking for my MEng degree.
You may (or may not!) be pleased to know that I showed that it is impossible
to construct a single program which is representative of programs "in
general".

1855. UK/Euro Mags/Dealers

Newsgroup: comp.sys.atari.st
Date: 1994-01-26 14:03:00 UTC
From: rost@tecrus.enet.dec.com
Message-ID: <CK8puq.Hxn@ryn.mro4.dec.com>
Source record: 194178

Help! Save me from buying a Macintosh!!!

With the US software situation in disarray, I'm interested in finding out about UK or European magazines or dealers. I need educational software for my kids (6 and 8 today, I'm looking for packages good for 8-12 year olds) and figure that *something* must exist over there.

Any US users who can tell me where to get European mags or (better yet) have dealt with overseas dealers, if you could give me some pointers, I'd apprecaite it.

UK/Euro users with suggestions, synpathy 8^), pity 8^) 8^), especially those who have experience with kid's software, please contact me.

Brian Rost @tecrus.enet.dec.com

Joe, you DO have your Cubase dongle connected don't you? :-)
I don't know what Cubase does without a dongle.
Also can you give some other examples of the problem, not related to
Cubase? Maybe your machine is sick, or your SM124, sorry I don't
have an SM124 (wish I did:-))

btw I had a complaint of a recent posting appearing twice on
some newsservers. Please inform me by e-mail if this happens again.

fountad@vax.sbu.ac.uk writes:

>Can someone just clarify a small C question for me?

First of all: wrong group. Please post questions to appropriate groups --
which might be comp.lang.c in this case. Second: buy a decent book on C. That
will answer more questions than you can come up with. A good book is Kernighan
& Ritchie, "The C programming language", 2nd edition.
Third: I know my reply in this group is as inappropriate as the original
posting is, but I hope that others wil refrain from sending follow-ups if they
see there already is a follow up.
I emailed a reply to the questions to the poster. I hope others will use
email too instead of posting. The S/R ratio already is bad enough in this
group.

Atari should distribute the sources of TOS just like they did with
MiNT versions 1.05 and up. You'll see that when they do, a few
freaks in Germany or the Netherlands etc. will build a more feasible
operating system in a few months. If Atari don't have more than one
or two people to work on TOS, then they should hand it over to its
users.

Is there some potential problem if the UNIX-box doesn't have the same
endinaness ? (it seems fine for Sparcs, but what about DECs?)

For the ST, you can get Llamatron, Revenge of the Mutant Camels, and Hardcore.
Also there is ColorspaceST (a graphic demo thingy). I have heard of a
Defender clone for the ST called Andes Attack, but I have never been able to
find it (anybody? Is it shareware?).

All of the above (except Andes Attack) are available via ftp from
atari.archive.umich.edu.

Hey, David!

It's a pleasure to see you in this group again! I remember your contributions
to this group back in the ST's good times. (Must have been around '85-'88.)
And the great UN*X-like multitasking environment that you had in those
early days. I played with it at the Dï¿½sseldorf exhibition, but apparently
it wasn't really marketed and supported in Germany, was it? What happened
to it? Do you still sell it? What does your company do now? (Personal
answer is welcome if this appears to conflict with this group's rules.)

BTW, does anybody here in this group know what happened to the other
"heroes" of the good old days? Just to mention a few names:
Simon Poole, Todd Burkey, Moshe Braner, Michael Vederman...
I'm certain that I forgot people that would deserve appearing in this list.
I apologize in advance.

Memories...

Yours
/Michael/

Please don't send anything larger than 64K to my Mausnet address.
Use eibl@thp.uni-koeln.de instead. Thank you.

What are the missing link bobs? Something I obviously haven't come across.
Speedwise I'd have to have my results with me but if I remember rightly with
32 x 32 sprites it was quicker to use my extension (ICBIS - working title)
when you used four or more and the speed was maintained for more, more so than
the STOS ones. I shift the sprites in all four bitplanes on the fly - it is a
low res only utility (although you could use some features in other modes
possibly). Sprites graphics are exactly the same as the STOS ones and use the
same format etc.. I'll post details after the Easter break ...

Richard.

I have the manual but it is very vague indeed on this subject. I tried the
method I think it suggested but it only partially worked - it recognised them
and accounted for them but the jumps were totally screwy when I analysed the
a compiled program (which obviously crashed out).

> Can I have a beta test copy of your sprite extension?
>
> Les

Certainly. It'll have to wait till the summer term though - it's at home at
the moment but the interpreter extension should be working fully after Easter!

Richard.

1874. Goal! by Dino Dini

>AEO.2@genie.geis.com

If anyone's interested in teletext generally, I wrote some teletext software for the ST about a year back to talk to my Morley adaptor which I had for a BBC B. It used a modified circuit from CeefaxST but should work with any adaptor. I wrote my own for the following reasons:

* I wanted something in colour - ie low res
* CeefaxST wouldn't work with electronically tuned adaptors
* My Morley adaptor was begging me to resurrect it

Hey and guess what - I wrote a STOS extension for it! The interpreter extension is a bit dodgy on the file side (because I did nasty things with the RS232 {port B is it?} register for speed) and the compiler extension is waiting for a correct method of internal libraries. Still it works and I have a nice suite of programs for grabbing subtitles, whole pages, carousels etc. even if they currently have to be used uncompiled.

Again, if anyone's interested in any of this stuff I'll EMail them after Easter - I also have Philip's Fax address for datasheets on the chipsets (an interesting read - honest!).

Thought I'd just mention that,

Richard.

: Amiga port of Linux would sorta just sit there and idle. Sure, that's
: some accomplishment, but not terribly useful.

Yes, but at least they are working on it... so you can bet
there will be a Linux for the amiga when the Atari users
still are hanging around with MTOS.
I really like my ST machine, I really like my 800XL... BUT
I think we can live with the past _and_ yet develope for
a better multitasking/multiuser OS.

1879. Re: C question

Newsgroup: comp.sys.atari.st
Date: 1994-01-26 19:02:39 UTC
From: woodford@esca.com
Message-ID: <1994Jan26.190239.21000@esca.com>
Source record: 194135

fountad@vax.sbu.ac.uk writes:

>Can someone just clarify a small C question for me?
>Whats the difference between

>char fluff[];

>and

>char *fluff;
The first specifies an array of characters, but does not specify the
number of characters in the array therefore cannot be used to allocate
memory, but can be used to declare an extern reference or function
argumennt.
The 2nd declares a pointer to a character, ie. it holds the address of
a character in memory.

>or indeed...

>char fluff[]="merkin";

>and

>char *fluff="merkin";
The first declares an array of 7 characters (the \0 is implicit) and
allocates 7 consecutive bytes in memory for them.
The 2nd effectively declares a pointer to an array of 7 characters.

>Thanks...
Your welcome.

Cheers, Steve

1880. Prices.... (was: Using CD-ROM)

>and executed from a hard disk. No wonder that common hard disk
>capacities going up and up. Fortunately for us, HD prices keep going
>down. :)

Actually, if one looks at 'valid' hardware & software, the price is
not going down. It's constant. On the other hand, as you say:
Performance is increasing rapidly:-)

What I mean is: five years ago, a well configuered computer did cost
about $1500 (US$) and was a 286 with EGA monitor, MS/DOS 3.xx, 1 Meg
ram and 40 MegDisk. Today, a decent configuration still costs $1500,
but now it's a 486DX33 with SVGA, MS/DOS 6.x & Windows 3.1, 4 Meg Ram
and 200 Meg disk!

(Prices are converted from Norwegian pricelevel. Your milage may vary:)

Sadly, the same price/performance race have not affected the Atari
scene with the same strenght these five last years (IMHO)!

>Anybody got any idea how to set UNIXMODE correctly?

I think I have mine set up as "cu/rUx" or something like that - which is how I saw someone's post showing that setting (in their own configuration). Seems to work properly (i.e. I get the case-sensitive characters, extended filenames, etc)...

Oh, if you want to see a cool way to name things (or subdirectories) - and this might help one or two of you looking to get files off the internet to use with Spectre GCR (see below) - you can have filenames like:

A Big FiLe

How? Put "quotes" around it when you refer to it - such as

mkdir "A Big FiLe"

This also works under unix. As for Spectre, in some of my software searches, I ran across files with filenames like this, but couldn't figure out how to download them. Well, doing the "quotes" should handle that problem...

Rob

...besides, minix file partitions in TURBO mode are *FAST* :-)

There is an option -l to tell patch not to care about the CRLF / LF
problem.

(There ought to be a man page, why do people never include man pages
to the binary distribution?)

1887. Here's a list of the Amiga-related files in NetBSD

Newsgroup: comp.sys.atari.st
Date: 1994-01-26 21:15:39 UTC
From: volker@sfb256.iam.uni-bonn.de
Message-ID: <2i6mhs$pe8@news.rhrz.uni-bonn.de>
Source record: 194117

For what it's worth, here's a list of all the files in the Amiga-specific part of the source tree of NetBSD 0.9. All of you out there interested in doing the port can see what's already out there. Most of these files aren't that big, and hopefully we can steal quite a bit from there ...

I would like to see a similar list for the 68K part of Linux.
